

CHAPTER 7

DROP TEST INTO WATER

7.1 DEFINITION OF TEST

This procedure describes the test conditions and the operations to be carried out during the Drop Test into Water.

It respect the definition drescribed in :

- Section A8.2 of RTCM Recommended Standards for 406 MHz Satellite EPIRBs;
- Section 6.6 of ETS 300-066;
- Section A1.7 of IEC 61097-2 and
- Section 8.6.2 of EN 60945

7.2. GENERAL DEFINITION OF TESTS

7.2.1. PURPOSE

- a) Ensure that beacons are switched off, and drop them into the water from a height of 20 m in three configurations:
 - Antenna vertical up
 - Antenna vertical down
 - Antenna horizontal
- b) Physically inspect beacons
- c) Do electrical tests of beacons

7.2.2. TEST SITE

The tests are conducted in a river lock-gate.

7.2.3. TEST EQUIPMENT

Beacon without stowage bracket.

The test is carried out using a hydrolic horst skiff able to reach 20 m height. The height is controlled by a calibrated halyard.

The beacon is held by the operator in the right position and released above the water area. An operator takes photographs of the test sequence in real time .

7.2.4. TEST SEQUENCE

The test sequence is as follows :

- 1 - Drop Test - Antenna vertical (up)
- 2 - Drop Test - Antenna vertical (down)
- 3 - Drop Test - Antenna horizontal

7.2.5. ORGANIZATION

- Conducting of the test : ITS
- Crane operation : ITS
- Operation and control of beacon : ITS / Manufacturer Representative
- Recovery of beacons : ITS
- Operation of camera : ITS
- Height and depth checks : ITS
- Signal for start of test : ITS (subject to agreement + manufacturer)

7.3. IMPLEMENTATION OF TEST

7.3.1. TIMING

- Preparation phase
 - Obtain agreement of lock-gate staff,
 - Record beacon identification,
 - Lift up the operator and beacon in the hoisting skiff control the height (20 m),
 - Set up camera,
 - Make sure diver is ready.
- Test phase
 - Obtain the ITS / CNES agreement for start of the test,
 - Drop the beacon
 - Take pictures before, during and at the end of the drop
- Control phase
 - Diver recovers beacon,
 - Mechanical and electrical checkout.

7.3.2. ENVIRONMENT

The tests conducted outside may therefore be subject to inclement weather such as wind, fog, icing and so on...

Decisions to postpone testing shall be taken jointly by ITS and Manufacturer Representative (if he is present).

7.2.3.3. SAFETY - QUALITY

All tests are to be conducted in the presence of ITS coordinator .

- Ensure that all personnel around the lock-gate is suitably dressed in view of the risk of slipping.

7.2.3.4. LOGISTICS

All tests are photographed in real time.

MT400 STANDARD COMMUNICATIONS PTY. LTD. EPIRB
Nº C203**

1 - ADMINISTRATION

1. WORK ORDER : Reference ITS : M4586

1. TEST TEAM : A.COURTINADE

1. SCHEDULE : 26 March 2003

2 - PURPOSE

The radiation tests of the dedicated radio beacon are performed in INTESPACE EMC Laboratory
in compliance with the test methods described in the COSPAS-SARSAT 406 MHz distress beacon
type approval standard : C/S T. 007- Issue 3 - Revision 9 - October 2002 .

3 - RADIO BEACON IDENTIFICATIONS

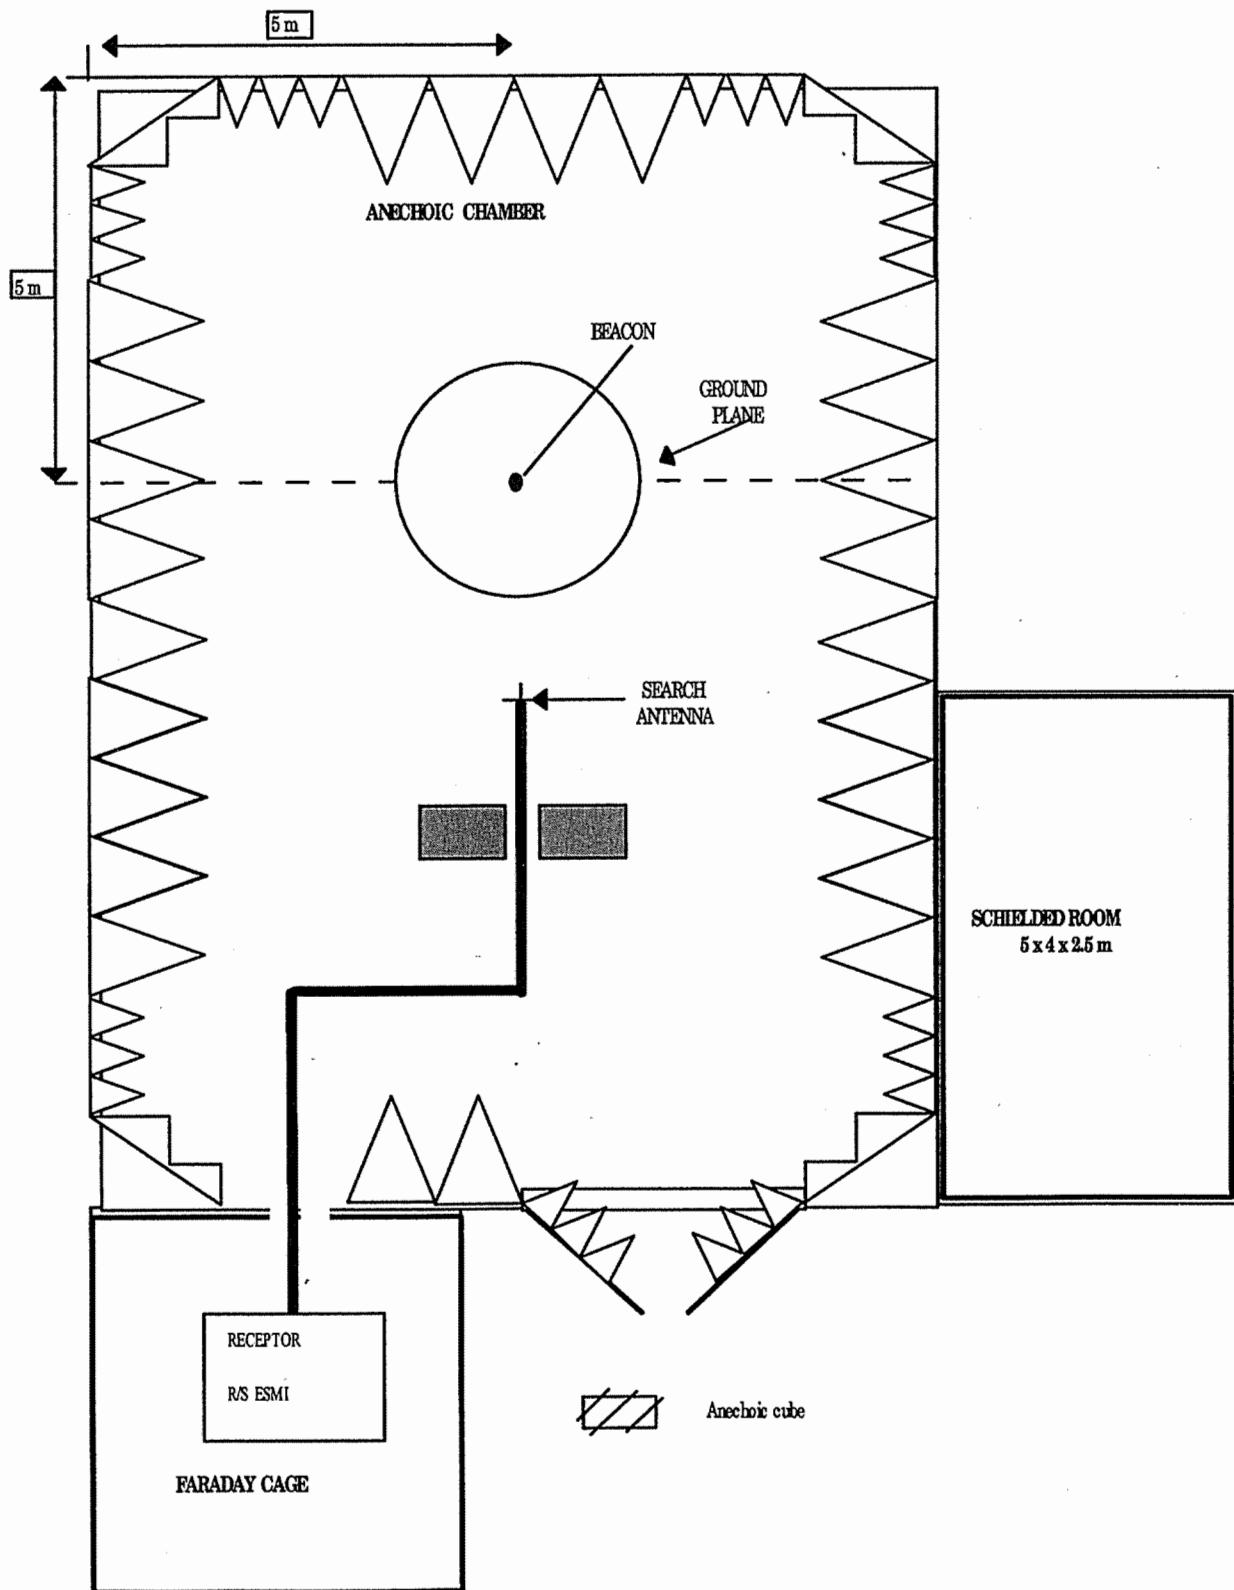

Manufacturer : Standard Communications Pty Ltd

Model N° : MT400

Serial N° : C203

Antenna : Standard Communications P/N : 46A0427

Tests are performed in an anechoic chamber (size 16 m x 10 m x 11 m)
Walls, ceiling and doors are lined with EMERSON CUMING foams VHP 36 and VHP 26 type.
The EPIRB is placed as shown on figure N° 1 and N° 2.

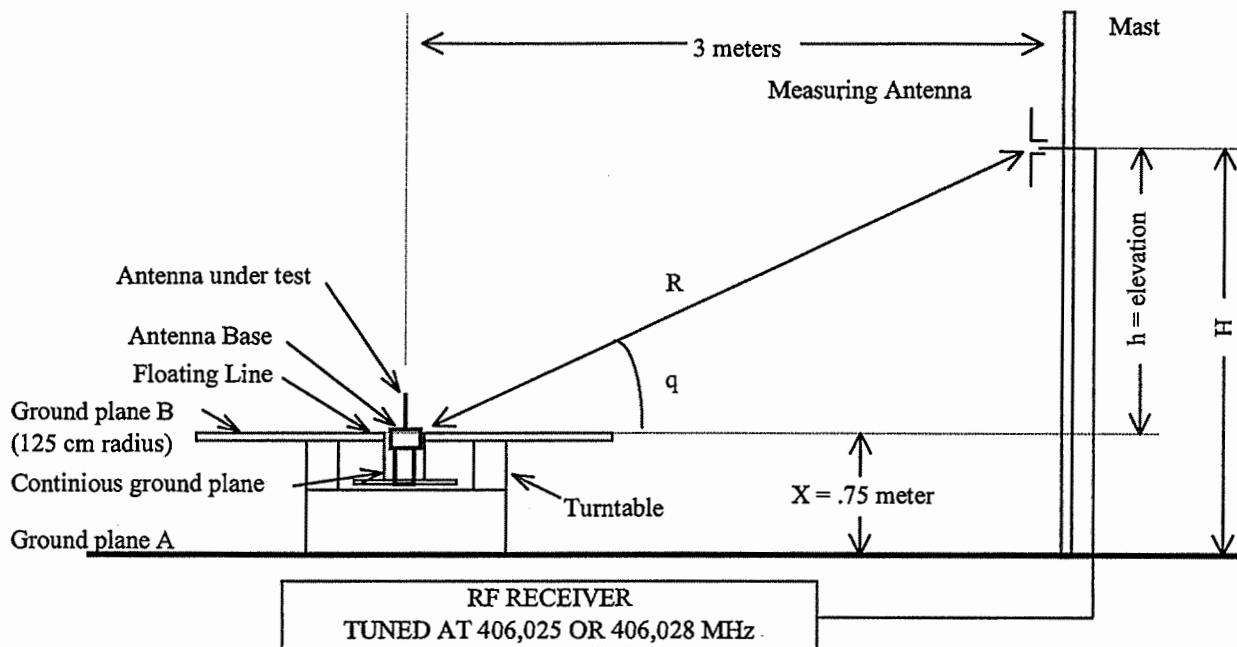

FIGURE B2c : Equipment Test Set Up For BEACON Antenna Test
(For BEACON designed for normal operation in water, ex: EPIRB)

5 - TEST METHOD

The test method describes here after, according to "C/S T 007 - Issue 3 -Revision 9 - October 2002 " test sequences is executed for 406 MHz frequency .

Following measurements are performed :

1/ Electrical ground plane of 1.25 m of radius is placed at flotation level of the beacon.

2/ EPIRB transmitting antenna polarization is determined prior to test.

3/ Determination of E field strength in term of $\text{dB}\mu\text{V/m}$ at 3 m far from the EPIRB for all direction (0° to 360° by step of 30°) and for search antenna elevation (10° to 50°). Search antenna is left in vertical and horizontal position for all elevations . Lenght of search antenna is adjusted to proper $1/2 \lambda$ conditions .

4/ An ERP (Equivalent Radiated Power) from the PLB is calculated

5/ ERP is corrected with ERP_{Loss} factor (end of life factor)

6/ Actual ERP are compared to specified ERP to be in the range 1.6 W to 20 W
(+ 32 dBm to + 43 dBm).

6 - TESTS EQUIPMENTS

6.1. SEARCH ANTENNA

- 406 MHz test : EMCO Ref 3121 C- DB4 Dipole antenna
- Serial number : S/N 9109-763
- Calibration validity : juin-02

6.2. SPECTRUM ANALYSER

- R/S ESMI

6.3. CABLES

- 20 m cable SUCOFLEX type 100 - cable loss at 406 MHz is : 3,5 dB

7 - TESTS OPERATIONS

7.1. EMISSION FIELD STRENGTH FROM EPIRB

The electrical field intensity is measured with the following antenna :

- EMCO 3121 C - DB4 - SN- 763

EPIRB electric field strength is obtained from measurement of the output voltage (dB μ V RMS) at antenna port (typical set up are shown figure N° 3 for 406 MHz) and computed with following parameters :

- Antenna factor of search antenna AF in dB (manufacturer calibration)
- Directivity factor of the antenna Dm in dB (Theoretical directivity shown paragraph B-5-4 of C/S T007) as :

$$Dm = 20 \log [\cos (90 \times \sin q) / \cos q]$$

- Cable loss L = 3,5 dB at 406 MHz

DF : distance factor in dB - To calculate field at a constant distance (3 m) from EPIRB due to the elevation of the search antenna.

- Power correction factor : end of life correction factor ERP_{Loss} is calculated from the difference between RF power measured during test and end of life power after 24 hours operation at min. Temp. This factor is applied to correct ERP as shown on final test result table
- The measurements are performed on the carrier signal, just before to apply the modulation.
- The effective field strength at 3 m from EPIRB is computed from :

$$EdB\mu V/m = UdB\mu V + AF + L + DF$$

Where : UdB μ V = $20 \log(CorV_v^2 + V_h^2)^{1/2}$

CorVv = Induced voltage with search antenna in vertical polar corrected by Dm

Vh = Induced voltage with search antenna in horizontal polar

7.2. POWER CORRECTION FACTORS

EOL factor

TEST FREQUENCY	RF Power measured at Ambient Temp. Test	RF Power measured at the end of Operating Lifetime Test	Loss Factor ERP_{LOSS}
406 MHz	36,1 dBm	36,6 dBm	-0,5 dB

The ERP_{LOSS} loss factor is rounded to : 0,0 dB

8 - RADIATED POWER CALCULATIONS

8.1. EFFECTIVE RADIATED POWER OF EPIRB

ERP of EPIRB is directly calculated from equation :

$$ERP = E^2 \times D^2 / 30$$

$$ERP = W$$

$$E = V/m$$

$$D = m$$

Results shown in table N° C1 are given in dBm where :

$$ERP \text{ dBm} = 10 \log (ERP \text{ W}) + 30$$

and apparent antenna gain :

$$GdB = ERPdBm - RF PowerdBm$$

9 - SUCCESS CRITERIA

90% of EPIRB measurements must be equal or greater than 1,6 W ERP (32 dBm).
and less than 20 W ERP (43 dBm)

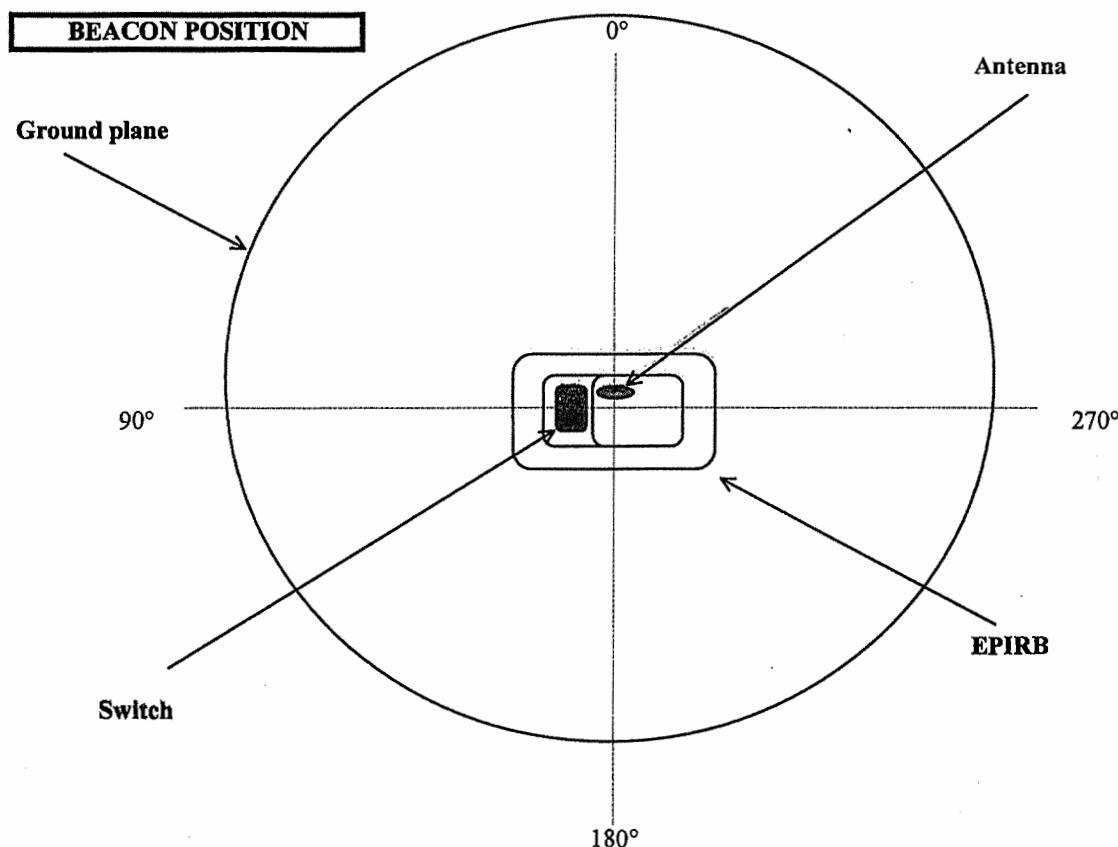

10 - EPIRB ANTENNA POLARIZATION

EPIRB antenna polarization is checked according to C/S T007 procedure paragraph B9 EPIRB antenna polarization is declared vertical when measurement obtained with vertical polarization search antenna are 10 dB greater or more than measurement obtained with

Antenna model	Angle Azi / Elev	Vertical measurement $dB\mu V$	Horizontal measurement $dB\mu V$	Δ	Antenna Polarization
	0°/10°	109,9	79,3	30,5	Vertical

11 - EPIRB MECHANICAL SET UP

EPIRB 0°axis is identified with 0° azimuth direction of turn table .
Antenna is the center of rotation of azimuth angle.
