

Differences Between the Base and Remote Units

4/25/07

Model -- PLS100 - PhoneLink Wireless Dial Tone Extender System

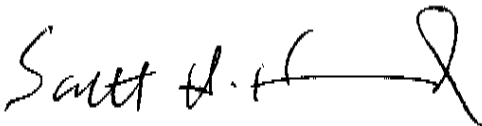

Part # -- PLB100 - Base unit

Part # -- PLR100 - Remote unit

The PhoneLink product consists of a single Base unit and a single Remote unit. Both units are the same except for the telephone line connections. The Base unit is connected to the public switched telephone network and behaves and loads a phone line like a standard telephone.

The Remote unit includes circuitry that behaves the same as the telephone company central office in that it generates a new dial up telephone line just like the central office. The user connects a standard telephone to the Remote unit. The Remote unit is NOT connected to the telephone network.

The RF circuitry is the same in both units.
