According to FCC §2.1049, the occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission.

Occupied bandwidth is also known as the 99% emission bandwidth. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26dB below the transmitter power.

3.4.2 Test Procedure

1. Perform test system setup as section 3.1.1.

3. The low, middle and the high channels are selected to perform tests respectively.
4. Set the frequency range of the Spectrum Analyzer suitably to capture the waveform; search peak; make a line whose value is 20dB lower than the peak; mark two points which the line intersected the waveform at; finally record the delta of the two points as the occupied bandwidth and the plot.

3.7.3 Test Result

The substitution corrections are obtained as described below:

$$SCF_{\text{Offset}} = Pg(\text{dBm}) - \text{cable loss (dB)} + \text{antenna gain (dB)} - Pr(\text{dBm})$$

Where Pg is the generator output power into the substitution antenna

Cable loss is the reduction in power between the generator and the substitution antenna

Antenna gain is the gain of the substitution antenna relative to an ideal half wave dipole antenna (for ERP) or isotropic radiator (for EIRP)

Pr is the spectrum analyzer reading

SCF_{Offset} is substitution correction factor.

Calculation example:

Band	SCF_{Offset}	$Pg(\text{dBm})$	cable loss (dB)	antenna gain	$Pr(\text{dBm})$
836M	38.7 dB	0 dBm	0.3 dB	7.94 dBd	-31.06 dBm
1880M	47 dB	0 dBm	1.3 dB	12.57 dBi	-35.73 dBm

During the test, the data of SCF_{Offset} was added in the Test Spectrum Analyze, so Spectrum

Analyze reading is the final values which contain the data of SCF_{Offset}.

3.9 Frequency Stability

3.9.1 Requirement

According to FCC section 22.355 and section 24.235, the frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. According to FCC section 2.1055, the test conditions are:

- (a) The temperature is varied from $-30\text{ }^{\circ}\text{C}$ to $+50\text{ }^{\circ}\text{C}$ at intervals of not more than $10\text{ }^{\circ}\text{C}$.
- (b) For hand carried battery powered equipment, the primary supply voltage is reduced to the battery operating end point which shall be specified by the manufacture. The supply voltage shall be measured at the input to the cable normally provided with the equipment, or at the power supply terminals if cables are not normally provided.

3.9.2 Test Description

Test Setup:

The EUT, which is powered by the DC Power Supply directly, is located in the Temperature Chamber. The EUT is commanded by the System Simulator (SS) to operate at the maximum output power. A call is established between the EUT and the SS via a Common Antenna.

Equipments List please refer to section 2.3.2

3.9.3 Test Procedure

1. Perform test system setup as section 3.1.3.
2. Set the voltage of the DC Power Supply to normal supply voltage (here used 3.7V) and the temperature of the Temperature Chamber to vary from $-30\text{ }^{\circ}\text{C}$ to $+50\text{ }^{\circ}\text{C}$ at intervals of $10\text{ }^{\circ}\text{C}$.
3. At each temperature level, the EUT is powered off and kept in the Temperature Chamber for two hours. After sufficient stabilization, turn on the EUT, command it via the System Simulator (SS) to operate at the maximum output power i.e. A communication link is established between the EUT and the SS.

4. The low, middle and the high channels are selected to perform tests respectively.
5. The frequency deviation is measured (directly read from the SS, which can report the parameter) within three minutes.
6. Set the voltage of the DC Power Supply to high extreme supply voltage (here used 4.2V) and the temperature of the Temperature Chamber to normal (here used +22 °C), then repeat step 3 to 8.
7. Set the voltage of the DC Power Supply to low extreme supply voltage (here used 3.6V) and the temperature of the Temperature Chamber to normal (here used +22 °C), then repeat step 3 to 8.
