Note 1: Host models were positioned in their single installation orientation as seen in the Test Setup Photos exhibit.

Note 2: For 9kHz-30MHz range, host model CEE100 was tested on low channel and no emissions within 10dB of the limit were detected. Due to high passing margin, 3 channel testing was not performed on CEE100 and host models CEB100 and CEM100 were not tested in this frequency range.

Note 3: For 18-25GHz range, only host model CEM100 was tested. No emissions were detected and noise floor was more than 20dB below the limit. Due to high passing margin, host models CEB100 and CEE100 were not tested in this frequency range.

Note 4: Not applicable since EUT is battery powered only.

## **4.2 RADIATED EMISSIONS MEASUREMENT**

### **4.2.1 LIMITS OF RADIATED EMISSIONS MEASUREMENT**

Radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emissions limits specified in Section 15.209(a).

| FREQUENCIES<br>(MHz) | FIELD STRENGTH<br>(microvolts/meter) | MEASUREMENT DISTANCE<br>(meters) |
|----------------------|--------------------------------------|----------------------------------|
| 0.009 ~ 0.490        | 2400/F(kHz)                          | 300                              |
| 0.490 ~ 1.705        | 24000/F(kHz)                         | 30                               |
| 1.705 ~ 30.0         | 30                                   | 30                               |
| 30 ~ 88              | 100                                  | 3                                |
| 88 ~ 216             | 150                                  | 3                                |
| 216 ~ 960            | 200                                  | 3                                |
| Above 960            | 500                                  | 3                                |

**NOTE:**

1. The lower limit shall apply at the transition frequencies.
2.  $\text{dB}\mu\text{V}/\text{m} = 20 * \log(\mu\text{V}/\text{m})$ .
3. As specified in 15.35(b), for frequencies above 1000MHz, field strength limits are based on the use of measurement instrumentation employing an average detector function. However, there is also a limit on the peak level of the emissions that is 20 dB above the maximum permitted average emission limit.
4. Limit conversion below 30MHz is done by using the square of an inverse linear distance extrapolation factor (40 dB/decade) as allowed in FCC 15.31(f)(2).  
$$\text{Limit}(3\text{m}) = \text{Limit}(30\text{m}) + 40 * \log(30/3) = \text{Limit}(30\text{m}) + 40$$
$$\text{Limit}(3\text{m}) = \text{Limit}(300\text{m}) + 40 * \log(300/3) = \text{Limit}(300\text{m}) + 80$$
5. RSS-GEN Table 6 H-field limits are 51.5dB lower than FCC 15.209(a) E-field limits. Measurements are performed in terms of magnetic field and converted to electric field using the free space impedance of  $377\Omega$  ( $E\text{-field} = H\text{-field} + 51.5$ ). Therefore resulting pass/fail margin would be the same if an E-field reading is compared to an E-field limit or an H-field reading is compared to an H-field limit.

#### 4.2.3 TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table 1.5 meters (above 1GHz) and 0.8 meters (below 1GHz) above the ground at a 3 meters semi-anechoic chamber.
- b. For below 30MHz, a loop antenna with its lowest point 1m above the ground was placed 3m away from the EUT and it was rotated 0 and 90 degrees around its vertical axis.
- c. In 30MHz-1GHz range, a biconilog antenna was mounted on a variable-height antenna tower and placed 3m away from the EUT. Antenna height was varied from 1 meter to 4 meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna were investigated. The table was rotated 360 degrees to determine the position of the highest radiation.
- d. In 1GHz-6GHz range, a horn antenna was mounted on a variable-height antenna tower and placed 3m away from the EUT. Antenna height was varied from 1 meter to 4 meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna were investigated. The table was rotated 360 degrees to determine the position of the highest radiation. Using the same antenna, the measurement distance was reduced to 1m in 6-18GHz range.
- e. In 18-25GHz a smaller horn antenna was used to make measurements at 0.1m away from the EUT.
- f. For battery operated equipment, tests were performed using fresh batteries.
- g. Following bandwidths were used during emissions testing:

| Freq. (MHz) | RBW    | VBW    | Pre-scan | Final                                     |
|-------------|--------|--------|----------|---|
| 0.009-0.15  | 200Hz  | 1kHz   | Peak     | Quasi Peak                                |
| 0.15-30     | 9kHz   | 30kHz  | Peak     | Quasi Peak                                |

| >1000       | 1MHz   | 3MHz   | Peak     | Peak Max Hold and RMS Power Avg Trace Avg |

If peak measurements were below the applicable limit, QPk and RMS measurements were not performed.
