Re: Location of Serial Number Label on Pegaso Series Product

To Whom It May Concern,

This letter is in response to the following statement concerning device labeling:

Per FCC Labeling policy only cell phones and cordless phones can have the label applied inside the battery compartment; all other devices must have special approval to do so by the FCC. Please submit an application letter with reasons why the label cannot be applied on the surface of the product.

The following statement outlines the reasons that the label is being placed inside the battery compartment on Datalogic new Pegaso Series product:

Due to industrial design requirements the battery cover on the Pegaso Series product was designed with sharp curves and does not have any flat areas. Affixing the serial number label to the surface of the battery cover and maintaining a reliable label to cover bond will be difficult and the label will wear and fall off during use. Instead we choose to affix the label inside the battery compartment where the label to product bond will be easier and more reliable. The product and battery are shipped to the end user separately so the end user will notice the serial number label with the FCC ID information when the battery is inserted in the product.

Best Regards,

Brian Kelly
