Explanation of Reassessment

We are applying for a reassessment on Model RE201 which is covered by 8310A-RE201 and FCCID: U5X-RE201X.

The transmitter circuit on this device was changed from SAW resonator control to allow crystal control. This was done to improve the frequency tolerance on the center frequency. Modulation, firmware and other operational characteristics were kept unchanged. We have performed all transmitter testing once again, and the results are attached to this reassessment application. They show compliance of the modified device to IC standards.

Dated this 22nd day of July, 2011.
