ADDENDUM TEST REPORT TO 93565-28<br>IPAD EMV<br>Model:<br>30056015 (uses 30019320 USB cable) 30056017 (uses 30019319 Ethernet/USB combo cable)

Tested To The Following Standards:

FCC Part 15 Subpart C Sections 15.225
and
RSS 210 Issue 8

Report No.: 93565-28B

Date of issue: July 18, 2013

Testing Certificates: 803.01,803.02, 803.05, 803.06

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

# ADMINISTRATIVE INFORMATION 

## Test Report Information

REPORT PREPARED FOR:

Magtek Incorporated
1710 Apollo Court
Seal Beach, CA 90740

Representative: Alireza Ashani
Customer Reference Number: 96283

DATE OF EQUIPMENT RECEIPT:
DATES) OF TESTING:

REPORT PREPARED BY:

Joyce Walker
CKC Laboratories, Inc.
5046 Sierra Pines Drive
Mariposa, CA 95338

Project Number: 93565

April 11, 2013
April 11-18, 2013

## Revision History

Original: Testing of IPAD EMV, 30056015 (uses 30019320 USB cable) and 30056017 (uses 30019319 Ethernet / USB combo cable) to FCC Part 15 Subpart C Sections 15.225 and RSS 210 Issue 8.
Addendum A: To add new partial 15.225 test data for the IPAD EMV, Model: 30056017 (uses 30019319 Ethernet/USB combo cable) due to modifications made to the EUT after the original testing had been completed. See appendix A for listing of modifications.
Addendum B: This change adds 15.207 test data and the equipment list used for frequency stability testing that were left out in the original testing, report 93565-28. In addition, to reduce confusion, the additional partial testing that appears in report 93565-28A was combined in Appendix A of this report in order to have one test report with all of the original testing and the testing that was performed after modifications were made to the EUT.
Note: the schematic that was in report 93565-28A was removed for confidentiality purposes.

## Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational modes) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm
Director of Quality Assurance \& Engineering Services CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S):
CKC Laboratories, Inc.
110 Olinda Place
Brea, CA 92823

## SUMMARY OF RESULTS

Standard / Specification: FCC Part 15 Subpart C 15.225 \& RSS 210 Issue 8

| Description | Test Procedure/Method | Results |
| :---: | :---: | :---: |
| Conducted Emissions | FCC Part 15 Subpart C Section 15.207 | Pass |
| RF Power Output | FCC Part 15 Subpart C Section 15.225(a) / 2.1046 | Pass |
| -20 dBc \& 99\% Occupied Bandwidth | FCC Part 15 Subpart C Section 15.225 / 2.1049 / RSS 210 | Pass |
| Field Strength of Spurious Radiated Emissions | FCC Part 15 Subpart C Section 15.225(b)(c) / 2.1053 | Pass |
| Radiated Emissions / Frequency Stability | FCC Part 15 Subpart C Section 15.225 (d)(e) / 2.1055(d) / 15.209 / ANSI C63.4 (2003) | Pass |

## Conditions During Testing

This list is a summary of the conditions noted for or modifications made to the equipment during testing.

## Summary of Conditions

Modifications during testing with Ethernet Interface: Copper tape shield installed into bottom cover over interface connections. Shield covers entire internal surface of the cover.
15.207 Testing: There were two test configurations: USB cable and Ethernet/USB combo cable. Since this EUT is transmitting at 13.56 MHz that fundamental emissions can be seen within the conducted emissions sweep $(150 \mathrm{kHz}$ to 30 MHz$)$. Since the fundamental emission exceeds the limit line for 15.207 it is allowed to replace the transmit antenna with an equivalent resistive load and repeat the test to show that it is not conducted. Therefore, the test was performed a second time with the transmitter output terminated into an equivalent resistor load.
Modifications during 15.225(d) radiated emissions testing with USB Interface: Jumper wire added on top of PCBA from sense line of stylus pen from board jack to signature capture screen.
Modification during 15.225 (d) radiated emissions testing with Ethernet Interface: Conductive paint over entire inside surface of back cover. Added jumper wire on top of PCBA from sense line of stylus pen from board jack to signature capture screen.

# EQUIPMENT UNDER TEST (EUT) 

## EQUIPMENT UNDER TEST

IPAD EMV
Manuf: Magtek Incorporated
Model: 30056017
Serial: 30

AC to 5VDC Power Supply
Manuf: DVE
Model: DSA-12PFA-05 FUS 050200
Serial: NA

## PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

## Laptop Computer

Manuf: Dell Corporation
Model: Latitude D520
Serial: H2JFYC1

## Fast Ethernet Switch

Manuf: Netgear
Model: FS105
Serial: 1D52173U01B60

LABORATORIES, INC.

## FCC PART 15 SUBPART C

This report contains EMC emissions test results under United States Federal Communications Commission (FCC) 47 CFR 15C requirements for Unlicensed Radio Frequency Devices, Subpart C - Intentional Radiators.

### 15.207 AC Conducted Emissions

Test Conditions / Notes:
The equipment under test (EUT) is stand alone on the Styrofoam tabletop. The EUT USB port is connected to a remotely located laptop. The AC to 5 Vdc power adapter is connected to the interface cable and providing power to the EUT. The EUT wireless 13.56 MHz is on and continuously transmitting. Frequency range of this data sheet: 9 kHz to 1000 MHz .9 kHz to $150 \mathrm{kHz}, \mathrm{RBW}=\mathrm{VBW}=200 \mathrm{~Hz} .150 \mathrm{kHz}$ to $30 \mathrm{MHz}, \mathrm{RBW}=\mathrm{VBW}=9 \mathrm{kHz} .30 \mathrm{MHz}$ to $1000 \mathrm{MHz}, \mathrm{RBW}=\mathrm{VBW}=120 \mathrm{kHz}$. Highest fundamental frequency is 13.56 MHz . Temperature: $20^{\circ} \mathrm{C}$, Humidity: $50 \%$, Pressure: 100 kPa . Site A. EUT with integral antenna.

## Test Conditions / Notes:

The equipment under test (EUT) and its AC to DC adapter are stand alone on the Styrofoam tabletop. The EUT ethernet port is connected to a remotely located switch. Also connected to the remotely located switch is the laptop computer. The AC to 5 Vdc power adapter is connected to the interface cable and providing power to the EUT. The EUT wireless 13.56 MHz is on and continuously transmitting. Frequency range of this data sheet: 9 kHz to 30 MHz .150 kHz to $30 \mathrm{MHz}, \mathrm{RBW}=\mathrm{VBW}=9 \mathrm{kHz}$. Temperature: $20^{\circ} \mathrm{C}$, Humidity: $36 \%$, Pressure: 100 kPa . Site A OATS. Modification: Copper tape shield installed into bottom cover over interface connections. Shield covers entire internal surface of the cover. Voltage to EUT is 110 Vac 60 Hz . EUT transmitting ON into normal antenna.

## Test Conditions / Notes:

The equipment under test (EUT) and its AC to DC adapter are stand alone on the Styrofoam tabletop. The EUT Ethernet port is connected to a remotely located switch. Also connected to the remotely located switch is the laptop computer. The AC to 5VDC power adapter is connected to the interface cable and providing power to the EUT. The EUT wireless 13.56 MHz is on and continuously transmitting. Frequency range of this data sheet: 9 kHz to 1000 MHz .9 kHz to $150 \mathrm{kHz}, \mathrm{RBW}=\mathrm{VBW}=200 \mathrm{~Hz} .150 \mathrm{kHz}$ to $30 \mathrm{MHz}, \mathrm{RBW}=\mathrm{VBW}=9 \mathrm{kHz} .30 \mathrm{MHz}$ to 1000 MHz , $\mathrm{RBW}=\mathrm{VBW}=120 \mathrm{kHz}$. Highest fundamental frequency is 13.56 MHz . Temperature: $20^{\circ} \mathrm{C}$, Humidity: $36 \%$, Pressure: 100 kPa . Site A OATS. Modification: Conductive paint over entire inside surface of back cover. Added jumper wire on top of PCBA from sense line of stylus pen from board jack to signature capture screen. Voltage to EUT is 110 Vac 60 Hz .

## Test Conditions / Notes:

The equipment under test (EUT) is placed inside the temperature chamber. The EUT Ethernet port is connected to a remotely located switch. Also connected to the remotely located switch is the laptop computer. The AC to 5VDC power adapter is connected to the interface cable and providing power to the EUT. Site A. Modification: Copper tape shield installed into bottom cover over interface connections. Shield covers entire internal surface of the cover. Voltage to EUT is 110 VAC 60 Hz . Near field probe placed on top of EUT to measure frequency and amplitude.

# APPENDIX A MODIFIED EUT TEST RESULTS 

# MANUFACTURER'S DESCRIPTION OF CHANGES TO <br> ANTENNA DRIVER BOARD IPAD EMV (30050735.5.01) <br> Robert Rodriguez <br> Thursday, May 23, 2013 

The antenna driver board was modified in order to pass EMVCo load modulation tests. The changes affect mainly capacitors C16, C49.

Capacitors C16, and C49 changed from 130 pF to 100 pF . This reflects the latest changes to the hardware and MagTek Documentation.

The changes impact load modulation reception for EMVCo specifications, and do not affect power transmission for FCC/CE radiated emissions.

To confirm this change didn't affect the radiated emission, pre-scans were performed on the fundamental frequency (i.e., 13.56 MHz ) and its harmonics. Test results at CKC laboratory for FCC Class B show there is no performance change when comparing before and after the capacitor magnitude changes.

## ADMINISTRATIVE INFORMATION

## Test Report Information

## REPORT PREPARED FOR:

Magtek Incorporated
1710 Apollo Court
Seal Beach, CA 90740

Representative: Alireza Ashani
Customer Reference Number: 96283

May 20-23, 2013

## Revision History

Original: Testing of IPAD EMV, 30056015 (uses 30019320 USB cable) and 30056017 (uses 30019319 Ethernet / USB combo cable) to FCC Part 15 Subpart C Sections 15.225 and RSS 210 Issue 8.
Addendum A: To add new partial 15.225 test data for the IPAD EMV, Model: 30056017 (uses 30019319
Ethernet/USB combo cable) due to modifications made to the EUT after the original testing had been completed.
See appendix A for listing of modifications.

## Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational modes) and configurations) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm
Director of Quality Assurance \& Engineering Services CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

## Conditions During Testing

This list is a summary of the conditions noted for or modifications made to the equipment during testing.

## Summary of Conditions

Modifications 15.225(a) RF Power testing: Copper tape shield installed into bottom cover over interface connections. Shield covers entire internal surface of the cover. Changed values of C16, C49 on the Antenna Driver PCB from 130pf to 100 pf. Voltage to EUT is 110 Vac 60 Hz .

Modifications $15.225(\mathrm{~d})$ radiated emissions testing: Conductive paint over entire inside surface of back cover. Added jumper wire on top of PCBA from sense line of stylus pen from board jack to signature capture screen. Changed values of C16, C49 on the Antenna Driver PCB from 130pf to 100pf. Voltage to EUT is 110 Vac 60 Hz .

# EQUIPMENT UNDER TEST (EUT) 

## EQUIPMENT UNDER TEST

IPAD EMV
Manuf: Magtek Incorporated
Model: 30056017
Serial: 30

AC to 5VDC Power Supply
Manuf: DVE
Model: DSA-12PFA-05 FUS 050200
Serial: NA

## PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

## Laptop Computer

Manuf: Dell Corporation
Model: Latitude D520
Serial: H2JFYC1

## Fast Ethernet Switch

Manuf: Netgear
Model: FS105
Serial: 1D52173U01B60

## FCC PART 15 SUBPART C

This report contains EMC emissions test results under United States Federal Communications Commission (FCC) 47 CFR 15C requirements for Unlicensed Radio Frequency Devices, Subpart C - Intentional Radiators.

## SUPPLEMENTAL INFORMATION

## Measurement Uncertainty

| Uncertainty Value | Parameter |
| :---: | :---: |
| 4.73 dB | Radiated Emissions |
| 3.34 dB | Mains Conducted Emissions |
| 3.30 dB | Disturbance Power |

The reported measurement uncertainties are calculated based on the worst case of all laboratory environments from CKC Laboratories, Inc. test sites. Only those parameters which require estimation of measurement uncertainty are reported. The reported worst case measurement uncertainty is less than the maximum values derived in CISPR 16-4-2. Reported uncertainties represent expanded uncertainties expressed at approximately the $95 \%$ confidence level using a coverage factor of $k=2$. Compliance is deemed to occur provided measurements are below the specified limits.

## Emissions Test Details

TESTING PARAMETERS
Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

## CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $\mathrm{dB} \mu \mathrm{V} / \mathrm{m}$, the spectrum analyzer reading in $\mathrm{dB} \mu \mathrm{V}$ was corrected by using the following formula. This reading was then compared to the applicable specification limit.

LABORATORIES, INC.

| SAMPLE CALCULATIONS |  |  |  |
| :--- | :--- | :--- | :---: |
|  | Meter reading | $(\mathrm{dB} \mathrm{\mu V})$ |  |
| + | Antenna Factor | $(\mathrm{dB})$ |  |
| + | Cable Loss | $(\mathrm{dB})$ |  |
| - | Distance Correction | $(\mathrm{dB})$ |  |
| - | Preamplifier Gain | $(\mathrm{dB})$ |  |
| $=$ | Corrected Reading | $(\mathrm{dB} \mathrm{\mu V/m)}$ |  |

## TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

| MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE |  |  |  |
| :---: | :---: | :---: | :---: |
| TEST | BEGINNING FREQUENCY | ENDING FREQUENCY | BANDWIDTH SETTING |
| CONDUCTED EMISSIONS | 150 kHz | 30 MHz | 9 kHz |
| RADIATED EMISSIONS | 9 kHz | 150 kHz | 200 Hz |
| RADIATED EMISSIONS | 150 kHz | 30 MHz | 9 kHz |
| RADIATED EMISSIONS | 30 MHz | 1000 MHz | 120 kHz |
| RADIATED EMISSIONS | 1000 MHz | $>1 \mathrm{GHz}$ | 1 MHz |

## SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

## Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

## Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

## Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
