The sample was tested according to the following specification:

FCC Parts 15.247; ANSI C-63.4-2003

3.2 Transmitter requirements

3.2.1 Carrier Frequency Separation

Procedure:

The carrier frequency separation was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

After the trace being stable, the reading value between the peaks of the adjacent channels using the marker-delta function was recorded as the measurement results.

The spectrum analyzer is set to:

Span = 3 MHz (wide enough to capture the peaks of two adjacent channels)

RBW = 30 kHz (1% of the span or more)   Sweep = auto

VBW = 30 kHz   Detector function = peak

Trace = max hold

Measurement Data:

Frequency of marker #1 (MHz)	Frequency of marker #2 (MHz)	Test Results	
		Carrier Frequency Separation (MHz)	Result
2439.986	2441.003	1.014	**Comply**

- See next pages for actual measured spectrum plots.

Minimum Standard:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW
Measurement Setup

Carrier Frequency Separation

3.2.2 Number of Hopping Frequencies

Procedure:

The number of hopping frequencies was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

To get higher resolution, four frequency ranges within the 2400 ~ 2483.5 MHz FH band were examined.

The spectrum analyzer is set to:

Frequency range   1: Start = 2389.5MHz,   Stop = 2414.5 MHz

2: Start = 2414.5MHz,   Stop = 2439.5 MHz

3: Start = 2439.5MHz,   Stop = 2464.5 MHz

4: Start = 2464.5MHz,   Stop = 2489.5 MHz

RBW = 300 kHz (1% of the span or more)   Sweep = auto

VBW = 300 kHz (VBW $\geq$ RBW)   Detector function = peak

Trace = max hold   Span = 25MHz

Measurement Data: Comply

| Total number of Hopping Channels	79

- See next pages for actual measured spectrum plots.
Minimum Standard:

At least 15 hopes

3.2.3 20 dB Bandwidth

Procedure:

The bandwidth at 20 dB below the highest inband spectral density was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission.   Use the marker-delta function to measure 20dB down one side of the emission.   Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level.   The marker-delta reading at this point is the 20 dB bandwidth of the emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

Span = 2 MHz (approximately 2 or 3 times of the 20 dB bandwidth)

RBW = 10 kHz (1% of the 20dB bandwidth   or more)   Sweep = auto

VBW = 30 kHz (VBW $\geq$ RBW)   Detector function = peak

Trace = max hold

Measurement Data:

		Measured Bandwidth (MHz)	Result

2441	40	0.935	**Comply**

3.2.4 Time of Occupancy (Dwell Time)

Procedure:

The dwell time was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

The spectrum analyzer is set to:

Center frequency = 2441 MHz   Span = zero

RBW = 1 MHz   VBW = 1 MHz (VBW $\geq$ RBW)

Trace = max hold   Detector function = peak

Measurement Data:

Packet Type	Burst duration in one hop (us)	Test Results	
		Dwell Time (ms)	**Result**
DH 1	**396**	**126.764**	**Comply**
DH 3	**1650**	**265.914**	**Comply**
DH 5	**2900**	**308.821**	**Comply**

- See next pages for actual measured spectrum plots.

Minimum Standard:

0.4 seconds within a 30 second period per any frequency
Measurement Setup

Same as the Chapter 3.2.1 (Figure 1)

Time of Occupancy for Packet Type DH 1

The system makes worst case 1600 hopes per second or 1 time slot has a length of 625 us with 79 channels.   A DH 1 Packet need 1 time slot for transmitting and 1 time slot for receiving.   Then the system makes worst case 1600/2 = 800 hops per second with 79 channels.   So you have each channel 800/79 = 10.13 times per second and so for a period of 0.4 x 79 = 31.6 seconds you have 10.13 x 31.6 = 320.11 times of appearance.

Each Tx-time per appearance is 396 us

So we have 320.11 x 396us = 126.764 ms per 31.6 seconds.

Time of Occupancy for Packet Type DH 3

The system makes worst case 1600 hopes per second or 1 time slot has a length of 625 us with 79 channels.   A DH 3 Packet need 3 time slot for transmitting and 1 time slot for receiving.   Then the system makes worst case 1600/4 = 400 hops per second with 79 channels.   So you have each channel 400/79 = 5.1 times per second and so for a period of 0.4 x 79 = 31.6 seconds you have 5.1 x 31.6 = 161.16 times of appearance.

Each Tx-time per appearance is 1.65 ms

So we have 161.16 x 1.65 ms = 265.914 ms per 31.6 seconds.

Time of Occupancy for Packet Type DH 5

The system makes worst case 1600 hopes per second or 1 time slot has a length of 625 us with 79 channels.   A DH 5 Packet need 5 time slot for transmitting and 1 time slot for receiving.   Then the system makes worst case 1600/6 = 266.67 hops per second with 79 channels.   So you have each channel 266.67/79 = 3.37 times per second and so for a period of 0.4 x 79 = 31.6 seconds you have 3.37 x 31.6 = 106.49 times of appearance.

Each Tx-time per appearance is 2.9ms

So we have 106.49 x 2.9 ms = 308.821 ms per 31.6 seconds.

.
3.2.5 Peak Output Power

Procedure:

The peak output power was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission.   The indicated level is the peak output power.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

Span = 5 MHz (approximately 5 times of the 20 dB bandwidth)

RBW = 1 MHz (greater than the 20dB bandwidth of the emission being measured)

VBW = 1 MHz (VBW $\geq$ RBW)   Detector function = peak

Trace = max hold   Sweep = auto

Measurement Data:

| Frequency (MHz)	Ch.	Test Results		
		dBm	mW	Result
2402	1	**3.65**	**2.317**	**Comply**
2441	40	**2.55**	**1.799**	**Comply**
2480	79	**1.47**	**1.403**	**Comply**

- See next pages for actual measured spectrum plots.

| Minimum Standard:	For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: **1 Watt**. For all other frequency hopping systems in the 2400-2483.5 MHz band: **0.125 Watts**

3.2.6 Conducted Spurious Emissions

Procedure:

After the trace being stable, Use the marker-to-peak function to measure 20 dB down both sides of the intentional emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

RBW = 100 kHz   VBW = 100 kHz

Span = 100 MHz   Detector function = peak

Trace = max hold   Sweep = auto

3.2.7 Radiated Emissions

Procedure:

The EUT was placed on a 0.8m high wooden table inside a shielded enclosure. An antenna was placed near the EUT and measurements of frequencies and amplitudes of field strengths were recorded for reference during final measurements. For final radiated testing, measurements were performed in OATS. Measurements were performed with the EUT oriented in 3 orthogonal axis and rotated 360 degrees to determine worst-case orientation for maximum emissions.

The spectrum analyzer is set to:

Center frequency = the worst channel

Frequency Range = 30 MHz ~ 10th harmonic.

RBW = 120 kHz (30MHz ~ 1 GHz)   VBW $\geq$ RBW (Peak)

= 1 MHz   (1 GHz ~ 10th harmonic)   VBW =   10Hz (Average)

Trace = max hold   Sweep = auto

Measurement Data: Comply

- Refer to the next page.
- The plot data for low and high restricted band edges is expressed in dBuV unit due to the spectrum analyzer is not support dBuV/m unit. But the results must be field strength value in dBuV/m unit because the results included offset value such as antenna factor, cable loss and external AMP gain

3.2.8 AC Line Conducted Emissions

Procedure:

The conducted emissions are measured in the shielded room with a spectrum analyzer in peak hold. While the measurement, EUT had its hopping function disabled at the middle channels in line with Section 15.31(m). Emissions closest to the limit are measured in the quasi-peak and average detector mode with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation and Exerciser operation. The highest emissions relative to the limit are listed.
