

## Maximum Target power of WLAN

### TX Power Setting

- Each product is programmed with the pre-defined RF parameters
- Each product RF power level is measured to ensure the power level not exceeding the target power level, in a fully calibrated setup.
- The user has no possibility to change these settings later on

Please find below the **Maximum** Transmit Power for production units:

Band / Frequency (MHz)	IEEE 802.11 Average Power (dBm)	
	11b	11g
2.4GHz Band	11.5	17.5

**Power unit: dBm**

The maximum output power, after for manufacturing tolerances, in production units will not exceed the value listed in the table above. Production units are all within (+0 , -3 dB) of this value.
