## 2 Test Information

### 2.1 Description of Test Modes

In accordance with FCC 15.31(m), and because the EUT utilizes an operating band greater than 10 MHz, the following frequencies were tested:

**Table 2-1: Channels Tested**

Channel	Frequency
0	2405
7	2440

## 5 Compliance with the Band Edge – FCC §15.247(d); RSS-210 §2.2

### 5.1 Band Edge Test Procedure

The transmitter output was connected to its appropriate antenna. Peak (1 MHz RBW/VBW) and average (1 MHz RBW/10 Hz VBW) radiated measurements were taken with a suitable span to encompass the peak of the fundamental. A delta measurement was performed from the highest peak in the restricted band to the peak of the fundamental, and subtracted from the field strength; the result was compared to the limit in the restricted band (54 dBuV/m).

## 5.2 Restricted Band Edge Test Results

### 5.2.1 Calculation of Lower Band Edge

91.8 dB<sub>V/m</sub> is the field strength measurement, from which the delta measurement of 44 dB is subtracted (reference plots), resulting in a level of 47.8 dB. This level has a margin of 6.2 dB below the limit of 54 dB<sub>V/m</sub>.

Calculation:  $91.8 \text{ dB}_V/\text{m} - 44 \text{ dB} - 54 \text{ dB}_V/\text{m} = -6.2 \text{ dB}$

Peak Field Strength of Lower Band Edge (1 MHz RBW/1 MHz VBW) = 96.5 dB<sub>V/m</sub>  
Average Field Strength of Lower Band Edge (Pk less duty cycle -4.7 dB) = 91.8 dB<sub>V/m</sub>  
Delta measurement = 44 dB

Plot 5-1: Lower Band Edge: Average Measurement Channel 1 (TX Frequency: 2405 MHz)

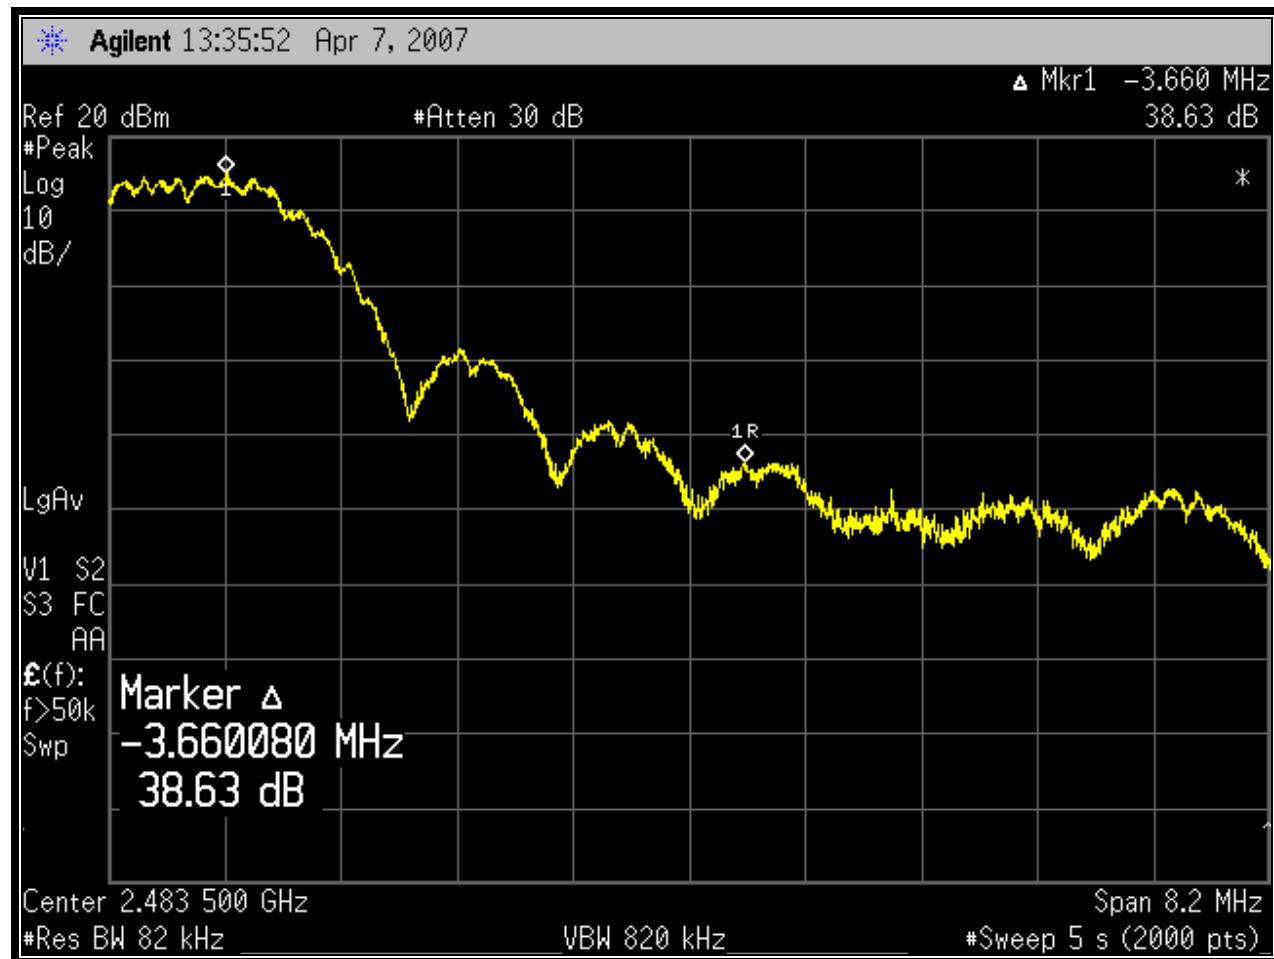

### 5.2.2 Calculation of Upper Band Edge

91.7 dBuV/m is the field strength measurement, from which the delta measurement of 38.6 dB is subtracted (reference plots), resulting in a level of 53.1 dB. This level has a margin of 0.9 dB below the limit of 54 dBuV/m.

Calculation:  $91.7 \text{ dBuV/m} - 38.6 \text{ dB} - 54 \text{ dBuV/m} = -0.9 \text{ dB}$

Peak Field Strength of Lower Band Edge (1 MHz RBW/1 MHz VBW) = 96.4 dBuV/m  
Average Field Strength of Lower Band Edge (Pk less duty cycle -4.7 dB) = 91.7 dBuV/m  
Delta measurement = 38.6 dB

## 8 Power Spectral Density - §15.247(e); RSS-210 §A8.2

### 8.1 Power Spectral Density Test Procedure

The power spectral density per FCC 15.247(d) was measured using a 50 ohm spectrum analyzer with the resolution bandwidth set at 3 kHz, the video bandwidth set at 30 kHz, and the sweep time set at 500 seconds. The spectral lines were resolved for the modulated carriers at 2.405 GHz, 2.440 GHz, and 2.480 GHz respectively. These levels are below the +8 dBm limit. See the power spectral density table and plots.

## 9 Conducted Limits - §15.207; RSS-Gen

The conducted limits testing is not required since the device is battery operated and cannot be connected to an AC power source.

## 10 Radiated Emissions - §15.209; RSS-210 §A8.5 and RSS-Gen

### 10.1 Limits of Radiated Emissions Measurement

Frequency (MHz)	Field Strength (uV/m)	Measurement Distance (m)
0.009-0.490	2400/f (kHz)	300
0.490-1.705	2400/f (kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

As shown in 15.35(b), for frequencies above 1000 MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any circumstances of modulation.

### 10.2 Radiated Emissions Measurement Test Procedure

Before final measurements of radiated emissions were made on the open-field three/ten meter range, the EUT was scanned indoors at one and three meter distances. This was done in order to determine its emissions spectrum signature. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emissions measurements on the open-field range, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made on the three/ten-meter, open-field test site. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 9 kHz to the 10<sup>th</sup> harmonic of the highest fundamental transmitter frequency (24.8 GHz).

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations. For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode. For emissions above 1000 MHz, emissions are measured using the average detector function with a minimum resolution bandwidth of 1 MHz. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.
