1 General Information

1.1 General Description

The EUT is a Microprocessor based product powered by DC 5V iRobot external power source. The Main unit is controlled by an Atmel ATMEGA168-20AU microprocessor that utilizes an 18.432 MHz crystal for timing and control. A USB interface controller FDTI FT232RL is used for serial PC interface.

The EUT has the following features:

- As a programmable device that is able to accept user commands via a USB/COM interface.
- As a stand alone device able to read external sensors and control actuators.

The brief circuit description is saved with filename: OpDes.pdf

2 Description of the radiated emission test

2.1 Test Procedure

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.4 – 2003.

The equipment under test (EUT) was placed on a non-conductive turntable with dimensions of 1.5m x 1m and 0.8m high above the ground. 3m from the EUT, a broadband antenna mounting on the mast received the signal strength. The turntable was rotated to maximize the emission level. The antenna was then moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated.

For below 30MHz, a loop antenna with its vertical plane is placed 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1 m above the ground.

2.2 Test Result

All other measurements are well below the limit. Thus, those highest emissions were presented in next page.

The emissions meeting the requirement of section 15.109 are based on measurements employing the CISPR quasi-peak detector below 1000MHz and average detector for frequencies above 1000MHz.

It was found that the EUT meet the FCC requirement.
