IC:6694A-DIGBT

Differences between BOHE-BT and 410BT:

The BOHE-BT is a hose end controller made to attach to the end of a faucet or hose bib. The solenoid that is actuated and the water valve is contained entirely within the plastics of the unit while the 410BT is made to be attached to an Anti-Siphon Valve, Inline valve, or Actuator. The solenoid is external. Operationally and functionally, they are identical, the only difference being the valve and water source they are attached to.
