

Explanation of model number differences:

The 190427 model is a board assembly with exposed electronic components on one side - this is what CKC tested. It has silkscreen on the component side with the 190427 model number, but no FCC or IC ID-code text.

The 190507 model is the 190427 with a plastic encapsulant covering the components and the silk-screened 190427 model number. The bottom side is left exposed, and is where the silk-screen is located listing 190507 model number and the two ID-codes.

The two models are electrically identical.

Fresenius will only market the 190507 model.
