

Response to TCB Questions

The photos of the antenna seen in the external photos document and test setup photos document look different. Please clarify.

The antenna module is an all-plastic housing with a rectangular antenna inside. The antenna seen in the test setup photos document is the first antenna prototype we made and for this, we placed the plastic handle offset to the left. We learned in subsequent user-testing that it would be better to change the plastic housing to put the handle in the center, since then it would work better for both right-handed and left-handed people. So the external photos we made for the submittal shows this centered handle. The rectangular antenna module inside, the cable leading up to the antenna module, and the ferrite on the cable, are unchanged between those 2 structures.
