

Test Report EMC

FCC listed test laboratory; Registration No. 91098
A description of the test site pursuant to 47 CFR 2.948 has
been filed with the Federal Communications Commission.

Test Laboratory:

VDE Prüf- und Zertifizierungsinstitut GmbH
VDE Testing and Certification Institute
Laboratory for EMC measurements

Merianstraße 28
D-63069 Offenbach

Tel.: +49 (0) 69 8306-747
Fax: +49 (0) 69 8306-620
E-mail: Stephan.Kloska@vde.com

Equipment under Test

Applicant:	Braun GmbH; Frankfurter Straße 145, 61476 Kronberg
Manufacturer:	Braun GmbH; Baumhofstrasse 40, 97828 Marktheidenfeld
File number:	263300-2570-0076/142493
EUT:	Tooth-brush with RF, rechargeable battery-powered
Brand/model:	BRAUN 3762
EUT received:	2010-07-05

Applied standards

Main Standard	Basic Standards
Standards that have been applied to the radio transmitter:	
47 CFR 15, Subpart C: Intentional Radiators § 15.249 (Operation within the band 2400 - 2483.5 MHz) as an alternative to the general radiated emission as provided in § 15.209	ANSI C63.4:2003
Standards that are applicable to the non-radio equipment:	
47 CFR 15, Subpart B: Unintentional Radiators in conjunction with CISPR Pub.22: 1997 Limits for class B equipment	ANSI C63.4:2003

Remarks: ---

Information about modifications to the EUT at the test laboratory:

In order to achieve compliance with the regulations, no modifications were made to the EUT in the course of the tests.

Result: Pass

Date of issue:	2011-04-13	
Tested by:	Mr. Wolfgang Klos EMC Test Engineer	
Reviewed:	Mr. Stephan Kloska, Dr.-Ing. Head of the Laboratory

This Test report contains only the results of a single investigation carried out on the product submitted. It is not a generally valid judgement by the VDE Testing and Certification Institute regarding the properties of similar products taken from current production. It does not apply to all VDE specifications applicable to the Tested products. It does not entitle the applicant to use the VDE certification mark and the mark "GS = geprüfte Sicherheit (approved safety)".

This Test report may only be passed to a third party in its complete wording including this preamble and the date of issue. Any publication or reproduction require the prior written approval of the VDE Testing and Certification Institute.

1 Description of the sample (EUT)

1.1 General description

Type of EUT:	<p>The object of this test report is a tooth brush handle with built-in radio transmitter operating in the 2400 - 2483,5 MHz band. It is part of a rechargeable power tooth brush application with external display unit (SmartGuide) consisting of</p> <ul style="list-style-type: none"> • Hand piece (with 2,4 GHz transmitter) Type 3762 • Display Unit (SmartGuide) with built-in 2,4 GHz receiver Type 3741 • Charger, Type 3757 <p>The battery-powered display unit (3741) and the Charger (3757) are not objects of this test report. These devices are objects of other reports.</p>
Intended use, typical applications:	<p>Electric tooth brush for domestic dental care. It will be used indoors only. The 2,4 GHz radio transmitter utilized in the tooth brush is intended to transmit information about</p> <ul style="list-style-type: none"> • brushing mode, • brushing time, • brushing force, • low battery, • brushhead replacement etc. <p>to the receiver built in the SmartGuide.</p>
Brand name:	BRAUN
Model/Type Designation:	3762
Serial Number:	None (Prototype)
Equipment Type:	Fix or mobile
Signal flow direction:	Operation in the 2400 - 2483,5 MHz band: Simplex
Construction of the equipment:	<p>Operation in the 2400 - 2483,5 MHz band Two units: One transmitter in the hand piece (Model 3762) and one receiver in the display unit (Model 3741)</p> <p><i>Note: "UNIT" means a physically separate item of the equipment. The equipment under test may consist of two separate units.</i></p>

1.2 Technical Specifications

1.2.1 Transmitter

1.2.1.1 Transmitter components

The 2,4 GHz ISM transmitter is integrated into the PCB.

1.2.1.2 Ports of the transmitter

Power ports:	Battery operated with rechargeable NiMH battery, charged on SmartCharger
Antenna ports:	No external antenna connector
Earth port:	Not applicable
Signal/control ports:	No external ports
Telecommunications ports:	No external ports

1.2.1.3 Transmitter (Transceiver) power supply

Type of power source:	DC/DC converter steps up battery voltage from 0.9 to 1.5V to a stabilized 3 Volt supply voltage for the electronic circuits.
Rated battery voltage:	DC 1.2 V
Lower extreme test source voltage:	DC 0.9 V in agreement with the applicant
Upper extreme test source voltage:	DC 1.5 V in agreement with the applicant
Automatic transmitter shut-off facility (of the final product):	No. Hand piece transmits in the 2400 MHz to 2483,5 MHz band only when motor is running and for 1 sec after motor has stopped or for 1 sec when toothbrush is put on the charger. Also when a button is pressed or when toothbrush is in setup mode.

Rated power consumption:	Not specified
Number of phases (if applicable):	N/A

Rated current:	
Protection class:	III

1.2.1.4 RF characteristics of the 2.4 GHz ISM transmitter

Operating frequency:	Uses 4 channels (2403 MHz, 2425 MHz, 2427 MHz, 2452 MHz) which are changed sequentially. Sequence repeats after 36 channel changes. Single packet is transmitted on all 4 channels at least one time before information will be updated.
Channel separation (if applicable):	Not applicable
Method of frequency generation:	Integrated PLL system to achieve self adaptive carrier frequency to antenna resonant frequency
Type of modulation:	Binary Frequency Shift Keying (2-FSK) for details refer to the specification of the front end IC
Modulation input signal characteristics:	The modulation signal is generated internally.
Duty cycle of the transmitter:	Duty cycle: in practical use approx. 18% while transmitting at each frequency Total length of one active transmission period: approx. 2 minutes per user, typically not more than 4 users per hour. Toothbrush transmits only when motor is running and for 1 sec after motor has stopped or for 1 sec when toothbrush is put on the charger. Also when a button is pressed or when toothbrush is in setup mode.
Intended temperature range:	For normal indoor use (5°C to +35°C)
Maximum rated transmitter output power (as stated by the manufacturer):	< 0,75 mW e.i.r.p.
Variable transmitter carrier output:	No, the output power of the transmitter is fix.
Product variants with alternate power levels:	None

1.2.1.5 Other constructional details

Oscillators, generated frequencies:	- Charge circuitry: 27 .. 39 kHz - DC/DC converter: approx. 600 kHz - Microprocessor and ISM Transmitter clock: 26,00 MHz (crystal oscillator)
Miscellaneous information	Integrated circuits: IC1 STM8L151G4U6 WFQFPN28 IC2 CC2500 IC5 TPS61070DDCR TSOT23

Disturbance sources/Components:

No.	Description	Manufacturer	Type designation	Remarks

2 Summary of test results

2.1 Transmitter test results

2.1.1 Evaluation against §15.249 (Operation within the 2400-2483.5 MHz band)

Test	Frequency range	Page	Remarks	Result
a) Electric field strength, fundamental frequency	2400 MHz - 2483,5 MHz	8	---	Pass
a) Electric field strength, Harmonics	1 GHz - 25 GHz ⁺⁾	8	---	Pass
Band edge compliance §15.215 c)	Band edges at 2400 MHz and 2483,5 MHz	12	---	Pass

⁺⁾ The upper value of the investigated frequency band was determined according to § 15.33 (b)(1).

2.1.2 Evaluation against §15.209 (Limits for radiated emissions of intentional radiators, general requirements)

Test	Frequency range	Page	Remarks	Result
a) Electric field strength	9 kHz - 490 kHz 0,49 MHz - 1,705 MHz 1,705 MHz - 30 MHz	16	---	Pass
	30 MHz - 88 MHz 88 MHz - 216 MHz 216 MHz - 960 MHz 960 MHz - 1 GHz	12	---	Pass
	1 GHz - 25 GHz ⁺⁾	8	---	Pass

⁺⁾ The upper value of the investigated frequency band was determined according to § 15.33 (b)(1).

2.1.3 Evaluation against §15.207 (Limits for conducted emissions of intentional radiators)

Test	Frequency range	Page	Remarks	Result
a) Conducted emissions	150 kHz - 500 kHz 0,5 MHz - 5 MHz 5 MHz - 30 MHz	---	---	Not applicable

2.2 Receiver test results

Not applicable

3 Test and measuring results

3.1 Radiated emissions in the frequency range 1 GHz to 25 GHz

General information about the test:

Tested by:	Klos, Wolfgang

1800128	Amplifier 15 GHz ... 40 GHz	MITEQ	JS3-18004000-50-8A	2009-05-25 (2 years)

Information concerning the test:

Test set-up:	The EUT was operated in the center on top of a non-conductive table of 80 cm height. The table was located in the center of the turntable. The measurement distance was 3 m.
Operating modes used:	Toothbrush operated with variable speed, transmitter on All 4 possible channel frequencies were tested.
Test procedure:	ANSI C63.4:2003, Clauses 8.3 and 13.1.4 and Annexures H.3 and H.4

Result: Pass

The radiated emissions of the EUT in the frequency range 1 GHz to 25 GHz were found to be equal or below the specified limits. The minimum margin of a measurement value to the limit was 30,5 dB at a fundamental frequency and 8,9 dB at a harmonic frequency.

Protocol:

Prior to the final measurements, exploratory measurements with a spectrum analyzer were made in order to determine the mode of operation and the arrangement of the EUT causing highest readings relative to the limit. These measurements were carried out with the EUT standing on the bottom, lying on the rear and lying on the side (brush tip to the left when display is facing the antenna). A freshly charged battery was used.

Emissions above the noise floor of the measuring system were only found while the brush was in operation. The motor speed did not have an influence to the level of emissions.

Final measurement:

The disturbance spectrum of the EUT was investigated by manually tuning the receiver to the disturbance frequencies detected with the preliminary measurements. The procedure according to Annex C of ANSI C63.4:2003 was applied for obtaining the maximum level of emissions. The orientation of the EUT causing the highest readings during the prescan was used. The final measurements were made using a freshly charged battery.

Receiver settings:

RBW/IF-Bandwidth: 1 MHz

Detectors: PK and AV

Meas. time: 100 ms

Measurement data sheets including summarizing tables showing the highest readings relative to the limit can be found on the following pages.

3.1.1 Summarizing tables of the highest measurement values relative to the limit, fundamental frequencies

Average

Fre- quency	Distance	Antenna Height	Polari- zation	EUT Angle	Measured Value	Limit	Margin	Measured value	Limit	Result

Measurements were made up to 25 GHz.

Above 9,612 GHz, no disturbances above the instrumentation noise floor were found.

Electric field strength, measured at 3 m

3.2 Band edge compliance

General information about the test:

Tested by:	Klos, Wolfgang
Test date:	2011-04-12
Environmental conditions:	23° C, 45 % r.h.

Instruments:		Test location: Laboratory		
Inventory number	Description	Manufacturer	Type	Date of Last Calibration
1800124	Test Receiver/Spectrum-Analyzer	R&S	ESIB 7	2010-09-22 (2 years)

Information concerning the test:

Test set-up:	<p>The EUT was operated on the surface of a non-conductive table of 80 cm height. It was supplied from the internal battery (fully charged).</p> <p>By using some adhesive tape, an open stub from a coaxial cable was attached to the enclosure of the EUT in the vicinity of the integral antenna contained in the EUT.</p>
Operating modes used:	Continuous operation of the toothbrush with transmitter on
Test procedure:	<p>The -20 dB bandwidth of the emissions at the lowest and the highest operating frequencies was measured under normal operating conditions by using the appropriate measuring function of the spectrum analyzer.</p> <p>Spectrum analyzer settings: Span: 2 MHz RBW: 100 kHz VBW: 300 kHz SWT: AUTO (5 ms) Detector type: Sample Trace: Repeated sweeps, max. hold over 500 sweeps min.</p> <p>Prior to the final measurements with 2 MHz span, a verification measurement with 10 MHz span and MaxPeak detector was made in order to verify that no higher peaks than shown in the plots with 2 MHz span are contained in the spectrum envelope.</p>

Result: Pass

The measured results indicate that the 20 dB bandwidth of the emission is contained within the frequency band designated in the rule section 15.249 under which the equipment is operated.

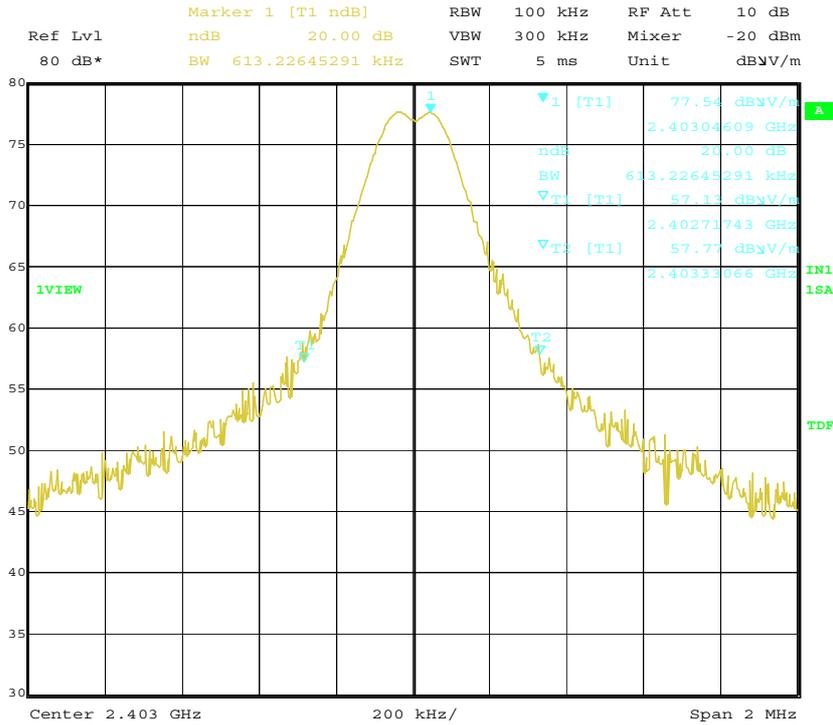

Protocol:

Lower edge frequency (-20 dB) of the emission at 2403 MHz: 2402,72 MHz
 Margin to the lower band edge at 2400 MHz: 2,72 MHz

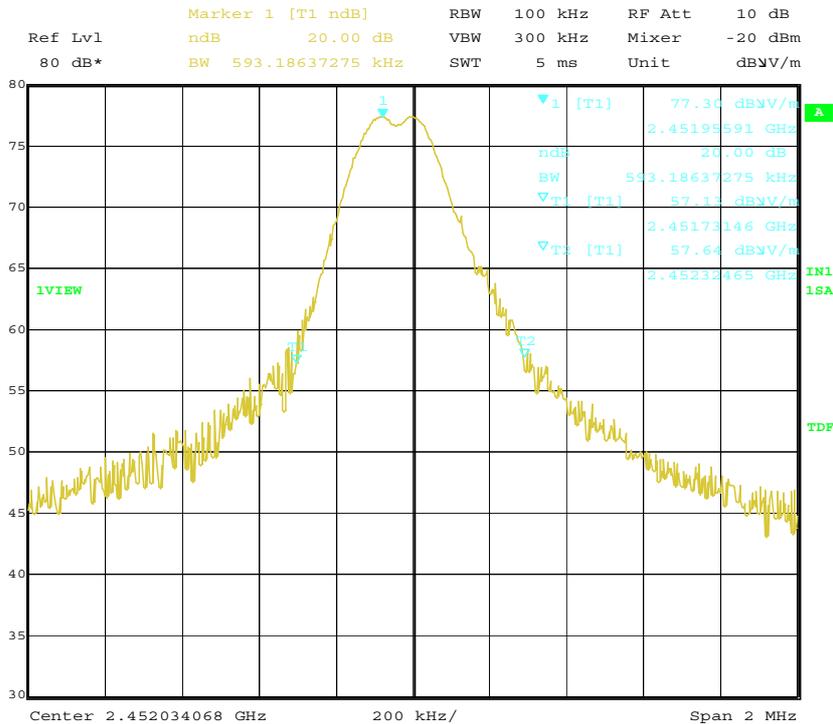

Upper edge frequency (-20 dB) of the emission at 2452 MHz: 2452,32 MHz
 Margin to the upper band edge at 2483,5 MHz: 31,18 MHz

Considering that the transmitter frequency is quartz-controlled and the supply voltage for the frequency-determining circuitry of the EUT is stabilized, good confidence is given that the device complies with the requirement to contain the designated bandwidth of the emission within the specified frequency band including the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage.

Spectrum analyzer plots are shown on the following page.

Date: 12.APR.2011 16:15:21
20 dB bandwidth at 2403 MHz

Date: 12.APR.2011 16:51:53
20 dB bandwidth at 2452 MHz

3.3 Radiated emissions in the frequency range 30 MHz – 1000 MHz

General information about the test:

Tested by:	Klos, Wolfgang
Test date:	2010-12-07

Instruments:		Test location: Semi-anechoic chamber (Building M)

Information concerning the test:

Test set-up:	The EUT was operated in the center on top of a non-conductive table of 80 cm height. The table was located in the center of the turntable. The measurement distance was 3 m.
Operating modes:	Toothbrush operated with variable speed, transmitter on. All 4 possible channel frequencies were tested.
Test procedure:	ANSI C63.4:2003, Clauses 8.3 and 13.1.4 and Annexures H.3 and H.4

Result: **Pass**

The measured radiated emissions of the EUT in the frequency range of 30 MHz to 1 GHz were found to be equal or below the specified limits.

The minimum margin of a measurement value to the limit was 16,8 dB.

Protocol:

Exploratory measurements

Prior to the final measurements, exploratory measurements were made in order to determine the mode of operation and the arrangement of the EUT causing highest readings relative to the limit. These measurements were carried out with the EUT standing on the bottom, lying on the rear and lying on the side (brush tip to the left when display is facing the antenna). The highest levels of emissions were found with the brush standing upright on the table. A freshly charged battery was used.

Emissions above the noise floor of the measuring system were only found while the brush was in operation. The motor speed did not have an influence to the level of emissions.

Final measurement

To obtain the final results, an automated scan sequence was run which followed the procedure according to Annex C of ANSI C63.4:2003 for obtaining the maximum level of emissions.

A CISPR-compliant test receiver was utilized for the final measurements.

At the beginning of the test sequence, the battery was freshly charged.

The highest reading found with the automated measurement was verified later using a freshly charged battery.

Receiver settings:

RBW/IF-Bandwidth: 120 kHz

Detector: QP

Meas. time: 2 s

Measurement data from the final test sequence can be found on the following page.

Result: **Pass**

**The measured radiated emissions of the EUT in the frequency range of 9 kHz to 30 MHz were found to be equal or below the specified limits.
The minimum margin of any measurement value to the limit was higher than 20 dB.**

Protocol:

Prior to the final measurements, exploratory measurements were made in order to determine the mode of operation and the arrangement of the EUT causing highest readings relative to the limit. A freshly charged battery was used.

The magnetic field strength was measured under normal operating conditions at a distance of 3 m. A distance correction factor of 40 dB/decade was applied.

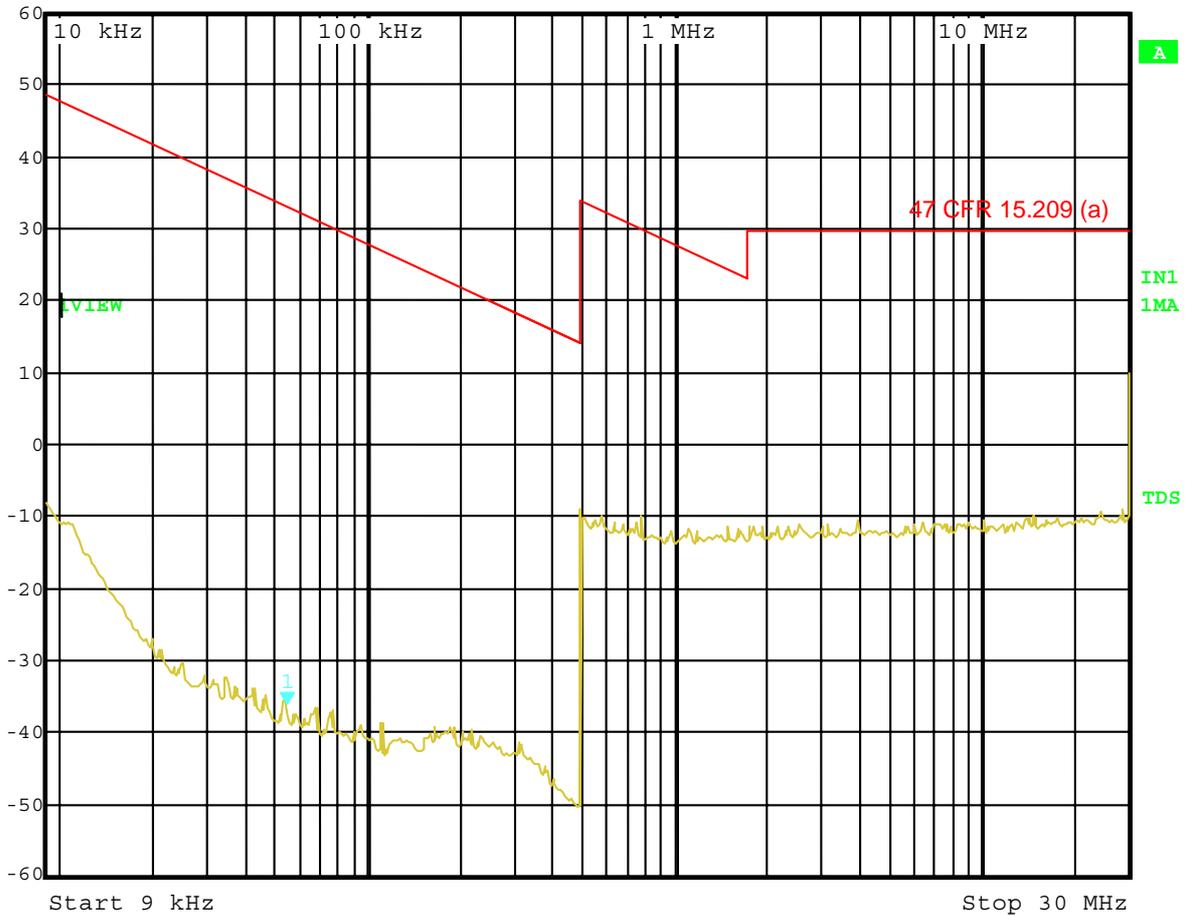

Preliminary scans with the peak detector and MaxHold function of a spectrum analyzer employed, and with the loop antenna oriented parallel and perpendicular to the measurement axis were made to capture the overall spectrum. Scans were run while the EUT was standing upright, lying on the rear and lying on the side.

A graphical representation of the results of one of these prescans is shown on the following page. It is representative for all scans made in this frequency range.

During these prescans, no readings above the noise floor of the test system were found. Therefore, no final measurement was made.
