

**POWER DENSITY ESTIMATIONS BASED ON POWER OUTPUT, ANTENNA GAIN, AND DISTANCE FROM ANTENNA**

$$( P G ) / ( 4 R ^ 2 \pi ) = S$$

<b>where:</b>	<b>S =</b>	maximum power density (mW/cm <sup>2</sup> )	<b>transmitter operating variables:</b>	<b>must be blank if dB values are entered</b>	
	<b>P =</b>	power input to the antenna ----->>	=	<b>6.05</b> (dBm) - or -	(mW)
	<b>G =</b>	gain of the antenna - worst case ----->>	=	<b>0.5</b> (dBi) - or -	(numeric gain)
	<b>R =</b>	distance to the center of the radiation of the antenna -->>	=	<b>20</b>	(cm)

$$( P \quad G ) / ( 4 * R ^ 2 * \pi ) = S \quad (mW/cm^2)$$

$$\left( \frac{4.027170343 \text{ (mw)}}{1.12202 \text{ (gain)}} \right) / \left( 4 * \frac{20 \text{ (cm)}}{}^2 * \pi \right) = S \quad (mW/cm^2)$$

$$( 4.518559444 ) / ( 4 * 400 * \pi ) = S \quad (mW/cm^2)$$

$$( 4.518559444 ) / ( 5026.548246 ) = 0.000899 \quad (mW/cm^2)$$
