According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] *·[f(GHz)] ≤ 3.0

The tune-up power is -1dBm +/- 2dB, therefore the highest tune-up power is
1.00 dBm (1.26 mW) @ 2402 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

(1.26mW / 5mm) * (2.402GHz ^0.5)= 0.4

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] * [f(GHz)] = 0.4 < 3.0

Therefore, standalone SAR measurements are not required for both head and body.
