

RADIO FREQUENCY EXPOSURE

LIMIT

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines. See §15.247(b)(4) and §1.1307(b)(1) of this chapter.

EUT Specification

EUT	Active Speaker(X300A Wireless)
Frequency band (Operating)	<input checked="" type="checkbox"/> WLAN: 2.412GHz ~ 2.462GHz <input type="checkbox"/> WLAN: 5.18GHz ~ 5.32GHz / 5.50GHz ~5.70GHz <input type="checkbox"/> Others
Device category	<input type="checkbox"/> Portable (<20cm separation) <input checked="" type="checkbox"/> Mobile (>20cm separation) <input type="checkbox"/> Others
Exposure classification	<input type="checkbox"/> Occupational/Controlled exposure (S = 5mW/cm ²) <input checked="" type="checkbox"/> General Population/Uncontrolled exposure (S=1mW/cm ²)
Max. output power	13.58 dBm (22.8mW)
Antenna gain (Max)	3.7 dBi (Numeric gain: 2.34)
Evaluation applied	<input checked="" type="checkbox"/> MPE Evaluation <input type="checkbox"/> SAR Evaluation
Note: 1. The maximum output power is 13.58 dBm (22.8mW) at 802.11b 2412MHz (with 2.34 numeric antenna gain .) 2. For mobile or fixed location transmitters, no SAR consideration applied. The minimum separation generally be used is at least 20 cm, even if the calculations indicate that the MPE distance would be lesser.	

TEST RESULTS

No non-compliance noted

Calculation

$$\text{Given } E = \sqrt{\frac{30 * P * G}{d}} \quad \& \quad S = \frac{E^2}{3770}$$

Where $E = \text{Field Strength in Volts / meter}$

$P = \text{Power in Watts}$

$G = \text{Numeric antenna gain}$

$d = \text{Distance in meters}$

$S = \text{Power Density in milliwatts / square centimeter}$

Combining equations and re-arranging the terms to express the distance as a function of the remaining variables yields:

$$d = \sqrt{\frac{30 * P * G}{3770 * S}}$$

Changing to units of mW and cm, using:

$$P (mW) = P (W) / 1000 \text{ and}$$

$$d (cm) = 100 * d (m)$$

Yields

$$d = 100 \times \sqrt{\frac{30 * (P/1000) * G}{3770 * S}} = 0.282 \times \sqrt{\frac{P * G}{S}}$$

Where $d = \text{distance in cm}$

$P = \text{Power in mW}$

$G = \text{Numeric antenna gain}$

$S = \text{Power Density in mW / cm}^2$

Substituting the logarithmic form of power and gain using:

$$P (mW) = 10^{(P (dBm) / 10)} \text{ and}$$

$$G (\text{numeric}) = 10^{(G (dBi) / 10)}$$

Yields

$$d = 0.282 \times \frac{10^{(P+G)/20}}{\sqrt{20}}$$

Equation 1

Where $d = \text{MPE safe distance in cm}$

$P = \text{Power in dBm}$

$G = \text{Antenna Gain in dBi}$

$S = \text{Power Density Limit in mW / cm}^2$

Maximum Permissible Exposure

EUT output power = 22.8mW

Antenna Gain = 2.34

S = 1.0 mW / cm² from 1.1310 Table 1

Substituting these parameters into the above Equation 1:

$$\rightarrow \text{MPE} = \frac{P * G}{4\pi R^2} = 0.0106 \text{ mW/cm}^2$$

(For mobile or fixed location transmitters, the minimum separation distance is 20 cm, even if calculations indicate that the MPE distance would be less.)
