## 2.3 Measurement Uncertainty

Two types of measurement uncertainty are expressed in this report, per *ISO Guide To The Expression Of Uncertainty In Measurement*, 1<sup>st</sup> Edition, 1995.

*The Combined Standard Uncertainty* is the standard uncertainty of the result of a measurement when that result is obtained from the values of a number of other quantities, equal to the positive square root of a sum of terms, the terms being the variances or co-variances of these other quantities weighted according to how the measurement result varies with changes in these quantities. The term standard uncertainty is the result of a measurement expressed as a standard deviation.

*The Expanded Uncertainty* defines an interval about the result of a measurement that may be expected to encompass a large fraction of the distribution of values that could reasonably be attributed to the measurand. The fraction may be viewed as the coverage probability or level of confidence of the interval.

### 2.3.1 Sample Calculation – radiated & conducted emissions

The field strength is calculated by subtracting the Amplifier Gain and adding the Cable Loss and Antenna Correction Factor to the measured reading. The basic equation is as follows:

$$\text{Field Strength (dB}\mu\text{V/m)} = \text{RAW} - \text{AMP} + \text{CBL} + \text{ACF}$$

Where: RAW = Measured level before correction (dBμV)

AMP = Amplifier Gain (dB)

CBL = Cable Loss (dB)

ACF = Antenna Correction Factor (dB/m)

$$\mu\text{V/m} = 10^{\frac{\text{dB}\mu\text{V} / \text{m}}{20}}$$

#### Sample radiated emissions calculation @ 30 MHz

Measurement +Antenna Factor–Amplifier Gain+Cable loss=Radiated Emissions (dBuV/m)

$$25 \text{ dBuV/m} + 17.5 \text{ dB} - 20 \text{ dB} + 1.0 \text{ dB} = 23.5 \text{ dBuV/m}$$

### 2.3.2 Measurement Uncertainty Emissions

Per CISPR 16-4-2	$U_{lab}$	$U_{cisp}$
<b>Radiated Disturbance @ 10 meters</b>		
30 – 1,000 MHz	2.25 dB	4.51 dB
<b>Radiated Disturbance @ 3 meters</b>		
30 – 1,000 MHz	2.26 dB	4.52 dB
1 – 6 GHz	2.12 dB	4.25 dB
6 – 18 GHz	2.47 dB	4.93 dB
<b>Conducted Disturbance @ Mains Terminals</b>		
150 kHz – 30 MHz	1.09 dB	2.18 dB
<b>Disturbance Power</b>		

#### Voltech PM600A

The estimated combined standard uncertainty for harmonic current and flicker measurements is $\pm 5.0\%$ .	Per CISPR 16-4-2
--	------------------

### 2.3.3 Measurement Uncertainty Immunity

The estimated expanded uncertainty for ESD immunity measurements is $\pm 8.2\%$ .	Per IEC 61000-4-2
The estimated expanded uncertainty for radiated immunity measurements is $\pm 4.10$ dB.	Per IEC 61000-4-3
The estimated expanded uncertainty for EFT fast transient immunity measurements is $\pm 5.84\%$ .	Per IEC 61000-4-4
The estimated expanded uncertainty for surge immunity measurements is $\pm 5.84 \%$ .	Per IEC 61000-4-4
The estimated expanded uncertainty for conducted immunity measurements with CDN is $\pm 3.66$ dB	Per IEC 61000-4-6
The estimated expanded uncertainty for power frequency magnetic field immunity is $\pm 11.6\%$ .	Per IEC 61000-4-8
The estimated expanded uncertainty for voltage variation and interruption measurements is $\pm 3.48\%$ .	Per IEC 61000-4-11

The expanded uncertainty at a level of 95% confidence is obtained by multiplying the combined standard uncertainty by a coverage factor of 2. Compliance criteria are not based on measurement uncertainty.

## 2.4 Calibration Traceability

All measurement instrumentation is traceable to the National Institute of Standards and Technology (NIST). Measurement method complies with ANSI/NCSL Z540-1-1994 and ISO Standard ISO IEC 17025:2017. Equipment calibration records are kept on file at the test facility.

#### 4.1.2 Test Procedure

Radiated emissions tests were performed using the procedures of CISPR 16 and/or ANSI C63.4 including methods for signal maximizations and EUT configuration. The photos included with the report show the EUT in its maximized configuration. Further radiated emission tests were performed per the procedures stated in the other emissions standards listed in this report.

The maximum EUT clock frequency is 32 MHz and 2.4 GHz BLE, so the frequency range 30 – 1000 MHz was investigated for radiated emissions.

RBW is set to 200Hz and VBW is set to 1 KHz for 9 KHz-150 KHz.

RBW is set to 9 KHz and VBW is set to 30 KHz for 150 KHz-30 MHz

RBW is set to 120 KHz, VBW is set to 300 KHz for 30MHz-1GHz.

RBW is set to 1MHz, VBW is set to 3MHz for above 1GHz.

#### 4.1.3 Deviations

There were no deviations from the test methodology listed in the test plan for the radiated emission test.

#### 4.1.4 Final Test

All final radiated emissions measurements were below (in compliance) the limits.

### 4.2.2 Test Procedure

Conducted and emissions tests were performed using the procedures of FCC 47 CFR Part 15 Subpart B: 2023, ICES-003: 2020 and/or ANSI C63.4 including methods for signal maximizations and EUT configuration. The photos included with the report show the EUT in its maximized configuration. Further conducted emission tests were performed per the procedures stated in the other emissions standards listed in this report.

The frequency range from 150 kHz - 30 MHz was investigated for conducted emissions.

Conducted Emissions measurements were performed in the shielded room using procedures specified in the test plan and standard.

### 4.2.3 Deviations

There were no deviations from the test methodology listed in the test plan for the conducted emission test.

### 4.2.4 Final Test

All final conducted emissions measurements were below (in compliance) the limits.
