3 Description of Equipment under Test

The EM7355 modem, referred to as “EUT” hereafter, is a multi-band wireless modem operating on the GSM/GPRS/EDGE/UMTS/LTE/CDMA networks. The table below shows the supported North American bands for the device.

Technology	Band	UL Freq. (MHz)	DL Freq. (MHz)	Max Power
LTE	B2	1850 – 1910	1930 – 1990	23 dBm (+/- 1 dB)
	B4	1710 – 1755	2110 – 2155	23 dBm (+/- 1 dB)
	B5	824 – 849	869 – 894	23 dBm (+/- 1 dB)
	B13	777 – 787	746 – 756	23 dBm (+/- 1 dB)
	B17	704 – 716	734 – 746	23 dBm (+/- 1 dB)
	B25	1850 – 1915	1930 – 1995	23 dBm (+/- 1 dB)

* Only BC10 subclass 2 and 3 frequencies are supported by hardware and firmware.

3.1 Differences between EM7355 and EM7655

The EM7355 and EM7655 differ only in pcb length and host interface connector. Both products utilize the same pcb RF layout, components and firmware. Please refer to document “7x55 Comparison.pdf”.

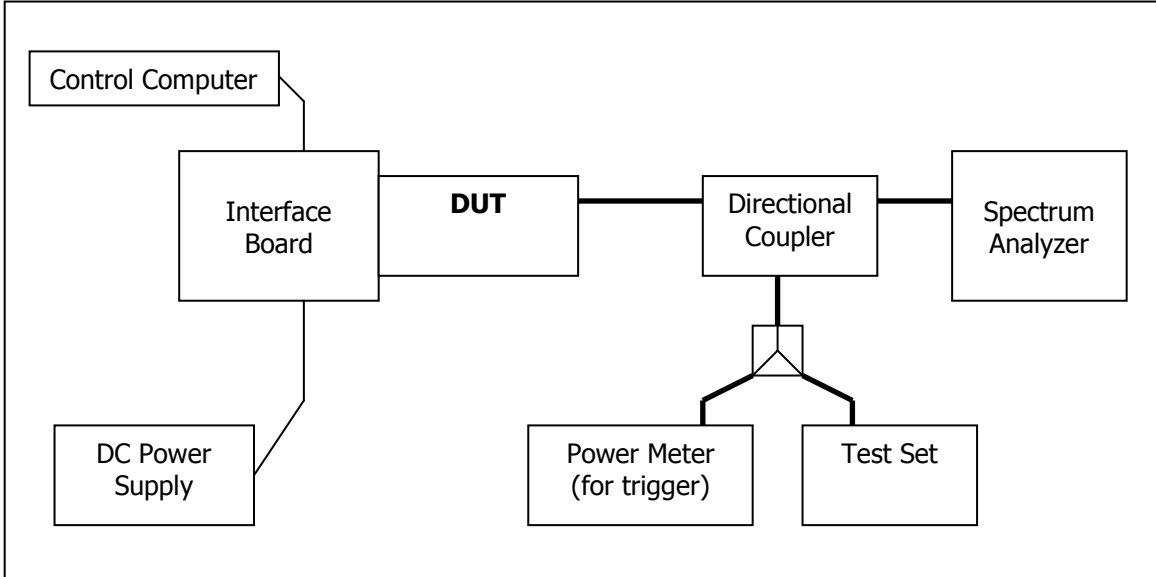

This report only contains the test data for bands supporting GSM / EDGE technologies.

6 RF Power Output

FCC 2.1046

6.1 Test Procedure

The transmitter output was connected to a Rohde & Schwarz Radio Communication Tester and configured to operate at maximum power in a call. The power was measured using the spectrum analyzer at three equally spaced operating frequencies for each band.

SIERRA WIRELESS, INC.

The RBW was set to 300 KHz for the GSM and EDGE measurements. The spectrum analyzer was set to measure the RF output power with the cable and coupler losses accounted for. Refer to Test Setup 1.

6.1.1 GSM/GPRS/EDGE Max Power Setup

Configure the Radio Communication Tester to support GMSK and 8PSK call respectively, and set one timeslot transmission for GMSK GSM/GPRS and 8PSK EDGE. Measure and record power outputs for both modulations.

7 Occupied Bandwidth

FCC 2.1049

7.1 Test Procedure

The transmitter output was connected to a spectrum analyzer through a calibrated coaxial cable and a directional coupler. The occupied bandwidth (defined as the 99% Power Bandwidth) was measured with the spectrum analyzer at low, middle, and high frequencies in each band. The -26dB bandwidth was also measured and recorded. Refer to Test Setup 1.

7.2 Test Results

The following GSM test results are based on single slot, and use coding scheme CS1 for GMSK and MCS9 for 8PSK mode.

8 Out of Band Emissions at Antenna Terminals

FCC 2.1051, 22.917, 24.238(a)

Out of Band Emissions:

The mean power of emissions must be attenuated below the mean power of the unmodulated carrier (P) on any frequency outside the frequency band by at least $(43 + 10 \log P)$ dB. The out of band emission limit translates to a worst case absolute limit of -13dBm in this case.

SIERRA WIRELESS, INC.

8.1 Test Procedure

The RF output of the transmitter was connected to a spectrum analyzer through a calibrated coaxial cable. Sufficient scans were taken to show the out-of-band emissions, if any, up to 10th harmonic. The EUT was scanned for spurious emissions from 1MHz to 20GHz with sufficient bandwidth and video resolution. Data plots are included. Multiple sweeps were recorded in maximum hold mode using a peak detector to ensure that the worst-case emissions were captured. Refer to Test Setup 1.

9 Block Edge Compliance

FCC Part 2.1051, 22.917, 24.238

9.1 Test Procedure

The transmitter output was connected to a Rohde & Schwarz Radio Communication Tester, through a coaxial RF cable and a directional coupler, and configured to operate at maximum power. The block edge emissions were measured at the required operating frequencies in each band on the Spectrum Analyzer. Refer to Test Setup 1.

10 Frequency Stability versus Temperature

FCC 2.1055, FCC 22.355, FCC 24.235

10.1 Summary of Results

The EUT's Frequency Stability versus temperature meets the requirements of less than 2.5ppm when temperature varies from -30°C to +50°C.

10.2 Test Procedure

The EUT was placed inside a temperature chamber. The temperature was set to -30°C and maintained to stabilize. After sufficient soak time, the transmitting frequency error was

measured. The temperature was then increased by 10 degrees, maintained to stabilize, and the measurement was repeated. This procedure was repeated until +50°C is reached. Frequency metering included internal averaging of the Radio Communication Tester to stabilize the reading. Reference power supply voltage for these tests is 3.7 volts. Refer to Test Setup 2.

11 Frequency Stability versus Voltage

FCC 2.1055, FCC 22.355, FCC 24.235

11.1 Summary of Results

The EUT is specified to operate with a supply voltage varying between 3.0 VDC and 4.2 VDC, having a nominal voltage of 3.7 VDC. It meets the frequency stability limit of less than 2.5ppm when supply voltage varies within the specified limits. Operation above or below these voltage limits is prohibited by firmware in order to prevent improper operation.

11.2 Test Procedure

The EUT was connected to a DC Power Supply and a Radio Communication Tester with frequency error measurement capability. The power supply output was adjusted to the test voltage as measured at the input terminals to the device while transmitting. A voltmeter was used to confirm the terminal voltage. The peak frequency error is recorded (worst case). The test voltages are 3.0 volts to 4.2 volts. Refer to Test Setup 2.
