

FCC SAR Test Report

APPLICANT : Motorola, Inc.
EQUIPMENT : Enterprise Digital Assistant (EDA)
BRAND NAME : Motorola
MODEL NAME : MC659B
FCC ID : UZ7MC659B
STANDARD : FCC 47 CFR Part 2 (2.1093)
IEEE C95.1-1999
IEEE 1528-2003
FCC OET Bulletin 65 Supplement C (Edition 01-01)

The product was received on Jan. 08, 2010 and completely tested on Feb. 07, 2010. We, SPORTON INTERNATIONAL INC., would like to declare that the tested sample has been evaluated in accordance with the procedures and shown the compliance with the applicable technical standards.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC., the test report shall not be reproduced except in full.

1. Statement of Compliance

The maximum results of Specific Absorption Rate (SAR) were found during testing for **Motorola, Inc. Enterprise Digital Assistant (EDA) Motorola MC659B**, which are as follows (with expanded uncertainty 21.4 % for 300 MHz to 3 GHz, and 25.6% for 3 GHz to 6 GHz).

<Standalone SAR>

Band	Position	SAR _{1g} (W/kg)
802.11b/g	Head	0.179
	Body (with 1.5 cm Gap)	0.045
	Body (with Holster 1)	0.152
	Body (with Holster 2)	0.035
802.11a	Head	0.527
	Body (with 1.5 cm Gap)	0.12
	Body (with Holster 1)	0.143
	Body (with Holster 2)	0.141
Bluetooth	Head	N/A
	Body	N/A

They are in compliance with Specific Absorption Rate (SAR) for general population/uncontrolled exposure limits (1.6 W/kg) specified in FCC 47 CFR part 2 (2.1093) and ANSI/IEEE C95.1-1999, and had been tested in accordance with the measurement methods and procedures specified in IEEE 1528-2003 and FCC OET Bulletin 65 Supplement C (Edition 01-01).

2. Administration Data

2.1 Testing Laboratory

Date of End during the Test	Feb. 07, 2010

3. General Information

3.1 Description of Device Under Test (DUT)

Product Feature & Specification	
DUT Type	Enterprise Digital Assistant (EDA)
Brand Name	Motorola
Model Name	MC659B
FCC ID	UZ7MC659B
Tx Frequency	802.11b/g : 2400 MHz ~ 2483.5 MHz 802.11a : 5150 MHz ~ 5350 MHz; 5470 MHz ~ 5725 MHz; 5725 MHz ~ 5850 MHz Bluetooth : 2400 MHz ~ 2483.5 MHz
Rx Frequency	802.11b/g : 2400 MHz ~ 2483.5 MHz 802.11a : 5150 MHz ~ 5350 MHz; 5470 MHz ~ 5725 MHz; 5725 MHz ~ 5850 MHz Bluetooth : 2400 MHz ~ 2483.5 MHz
Maximum Output Power to Antenna	802.11b : 16.82 dBm 802.11g : 21.67 dBm 802.11a : 19.87 dBm Bluetooth : 3.97 dBm
Antenna Type	WLAN : PIFA Antenna Bluetooth : PCB Antenna
HW Version	EVT2
SW Version	BSP2410
Type of Modulation	802.11b : DSSS (BPSK / QPSK / CCK) 802.11a/g : OFDM (BPSK / QPSK / 16QAM / 64QAM) Bluetooth (1Mbps) : GFSK Bluetooth EDR (2Mbps) : $\pi/4$ -DQPSK Bluetooth EDR (3Mbps) : 8-DPSK
DUT Stage	Identical Prototype

List of Accessory:

Specification of Accessory		
AC Adapter	Brand Name	MOTOROLA
	Model Name	EADP-16BB A
	Power Rating	I/P:100-240Vac, 50-60Hz, 0.4A; O/P: 5.4Vdc, 3A
	DC Power Cord Type	1.94 meter shielded cable without ferrite core
Battery	Brand Name	MOTOROLA
	Model Name	82-111094-01
	Power Rating	3.7Vdc, 3600mAh
	Type	Li-ion
USB Cable	Brand Name	MOTOROLA
	Model Name	25-108022-01R
	Signal Line Type	1.5 meter shielded cable with ferrite core

	Model Name	TD035SHED1
Camera	Brand Name	MOTOROLA JABIL
	Model Name	PD6234B
Holster 1	Brand Name	MOTOROLA
	Model Name	SG-MC5511110-01R
Holster 2	Brand Name	MOTOROLA
	Model Name	SG-MC5521110-01R

Remark: The above DUT's information was declared by manufacturer. Please refer to the specifications or user's manual for more detailed description.

3.2 Product Photos

Please refer to Appendix D.

3.3 Applied Standards

The Specific Absorption Rate (SAR) testing specification, method and procedure for this Enterprise Digital Assistant (EDA) is in accordance with the following standards:

- FCC 47 CFR Part 2 (2.1093)
- IEEE C95.1-1999
- IEEE 1528-2003
- FCC OET Bulletin 65 Supplement C (Edition 01-01)
- FCC KDB 248227 D01 v01r02
- FCC KDB 648474 D01 v01r05

3.4 Device Category and SAR Limits

This device belongs to portable device category because its radiating structure is allowed to be used within 20 centimeters of the body of the user. Limit for General Population/Uncontrolled exposure should be applied for this device, it is 1.6 W/kg as averaged over any 1 gram of tissue.

3.5 Test Conditions

3.5.1 **Ambient Condition**

Ambient Temperature	20 to 24 °C
Humidity	< 60 %

3.5.2 **Test Configuration**

For WLAN SAR testing, WLAN engineering testing software installed on the DUT can provide continuous transmitting RF signal. This RF signal utilized in SAR measurement has almost 100% duty cycle and its crest factor is 1.

According to the unlicensed transmitters of KDB 648474,

- test highest output channel only if SAR is ≤ 0.8 W/kg
- test all required channels if SAR is > 0.8 W/kg

The data rates for WLAN SAR testing were set in 1 Mbps for 802.11b, 6 Mbps for 802.11g, and 6 Mbps for 802.11a due to the highest RF output power which was measured by power meter. The RF power table of 802.11a/b/g is as below:

<Peak Power>

802.11b	Data Rate	1 Mbps	2 Mbps	5.5 Mbps	11 Mbps
	CH 01	16.38	16.38	16.31	16.37
	CH 06	16.23	16.17	16.13	16.19
	CH 11	16.82	16.77	16.74	16.72

802.11g	Data Rate	6 Mbps	9 Mbps	12 Mbps	18 Mbps	24 Mbps	36 Mbps	48 Mbps	54 Mbps
	CH 01	20.30	20.28	20.71	20.14	20.50	20.45	20.25	20.36

	CH 120	14.36	14.33	14.28	14.30	14.03	11.43	10.91	9.75
	CH 140	10.12	10.04	9.94	9.89	9.73	9.53	9.53	9.51
	CH 149	13.92	13.84	13.82	13.80	13.50	11.59	10.69	9.68
	CH 157	13.93	13.73	13.87	13.85	13.70	11.39	10.31	9.46
	CH 165	14.01	13.82	13.72	13.70	13.50	11.25	10.11	9.44

The simultaneous transmission SAR for WLAN and BT was not required because the closest separation distance of these antennas (7.4 cm) is larger than 5 cm and the output power of Bluetooth (3.97 dBm) is less than $2P_{Ref}$ (13.8 dBm).

4. Specific Absorption Rate (SAR)

4.1 Introduction

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

4.2 SAR Definition

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density (ρ). The equation description is as below:

$$\text{SAR} = \frac{d}{dt} \left(\frac{dW}{dm} \right) = \frac{d}{dt} \left(\frac{dW}{\rho dv} \right)$$

SAR is expressed in units of Watts per kilogram (W/kg)

SAR measurement can be either related to the temperature elevation in tissue by

$$\text{SAR} = C \left(\frac{\delta T}{\delta t} \right)$$

Where: C is the specific heat capacity, δT is the temperature rise and δt is the exposure duration, or related to the electrical field in the tissue by

$$\text{SAR} = \frac{\sigma |E|^2}{\rho}$$

Where: σ is the conductivity of the tissue, ρ is the mass density of the tissue and E is the RMS electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

5. SAR Measurement System

Fig 5.1 SPEAG DASY4 or DASY5 System Configurations

The DASY4 or DASY5 system for performance compliance tests is illustrated above graphically. This system consists of the following items:

- A standard high precision 6-axis robot with controller, a teach pendant and software
- A data acquisition electronic (DAE) attached to the robot arm extension
- A dosimetric probe equipped with an optical surface detector system
- The electro-optical converter (ECO) performs the conversion between optical and electrical signals
- A measurement server performs the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the accuracy of the probe positioning
- A computer operating Windows XP
- DASY4 or DASY5 software
- Remote control with teach pendant and additional circuitry for robot safety such as warning lamps, etc.
- The SAM twin phantom
- A device holder
- Tissue simulating liquid
- Dipole for evaluating the proper functioning of the system

Some of the components are described in details in the following sub-sections.

5.1 E-Field Probe

The SAR measurement is conducted with the dosimetric probe (manufactured by SPEAG).The probe is specially designed and calibrated for use in liquid with high permittivity. The dosimetric probe has special calibration in liquid at different frequency. This probe has a built in optical surface detection system to prevent from collision with phantom.

5.1.1 E-Field Probe Specification

<ET3DV6>

Construction	Symmetrical design with triangular core Built-in optical fiber for surface detection system. Built-in shielding against static charges. PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Frequency	10 MHz to 3 GHz; Linearity: ± 0.2 dB
Directivity	± 0.2 dB in HSL (rotation around probe axis) ± 0.4 dB in HSL (rotation normal to probe axis)
Dynamic Range	5 μ W/g to 100 mW/g; Linearity: ± 0.2 dB
Dimensions	Overall length: 330 mm (Tip: 16 mm) Tip diameter: 6.8 mm (Body: 12 mm) Distance from probe tip to dipole centers: 2.7 mm

Fig 5.2 Photo of ET3DV6

<EX3DV3 Probe>

Construction	Symmetrical design with triangular core Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Frequency	10 MHz to 6 GHz; Linearity: ± 0.2 dB
Directivity	± 0.3 dB in HSL (rotation around probe axis) ± 0.5 dB in tissue material (rotation normal to probe axis)
Dynamic Range	10 μ W/g to 100 mW/g; Linearity: ± 0.2 dB (noise: typically < 1 μ W/g)
Dimensions	Overall length: 330 mm (Tip: 20 mm) Tip diameter: 2.5 mm (Body: 12 mm) Typical distance from probe tip to dipole centers: 1 mm

Fig 5.3 Photo of EX3DV3

5.1.2 E-Field Probe Calibration

Each probe needs to be calibrated according to a dosimetric assessment procedure with accuracy better than $\pm 10\%$. The spherical isotropy shall be evaluated and within ± 0.25 dB. The sensitivity parameters (NormX, NormY, and NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested. The calibration data can be referred to appendix C of this report.

5.2 Data Acquisition Electronics (DAE)

The data acquisition electronics (DAE) consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information as well as an optical uplink for commands and the clock. The input impedance of the DAE is 200 MOhm; the inputs are symmetrical and floating. Common mode rejection is above 80 dB.

Fig 5.4 Photo of DAE

5.3 Robot

The SPEAG DASY system uses the high precision robots (DASY4: RX90BL; DASY5: TX90XL) type from Stäubli SA (France). For the 6-axis controller system, the robot controller version (DASY4: CS7MB; DASY5: CS8c) from Stäubli is used. The Stäubli robot series have many features that are important for our application:

- High precision (repeatability ± 0.035 mm)
- High reliability (industrial design)
- Jerk-free straight movements
- Low ELF interference (the closed metallic construction shields against motor control fields)

Fig 5.5 Photo of DASY4

Fig 5.6 Photo of DASY5

5.4 Measurement Server

The measurement server is based on a PC/104 CPU board with CPU (DASY4: 166 MHz, Intel Pentium; DASY5: 400 MHz, Intel Celeron), chipdisk (DASY4: 32 MB; DASY5: 128 MB), RAM (DASY4: 64 MB, DASY5: 128 MB). The necessary circuits for communication with the DAE electronic box, as well as the 16 bit AD converter system for optical detection and digital I/O interface are contained on the DASY I/O board, which is directly connected to the PC/104 bus of the CPU board.

The measurement server performs all the real-time data evaluation for field measurements and surface detection, controls robot movements and handles safety operations.

Fig 5.7 Photo of Server for DASY4

Fig 5.8 Photo of Server for DASY5

5.5 Phantom

<SAM Twin Phantom>

Shell Thickness	2 ± 0.2 mm; Center ear point: 6 ± 0.2 mm	 <p>Fig 5.9 Photo of SAM Phantom</p>
Filling Volume	Approx. 25 liters	
Dimensions	Length: 1000 mm; Width: 500 mm; Height: adjustable feet	
Measurement Areas	Left Hand, Right Hand, Flat Phantom	

The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections. A white cover is provided to tap the phantom during off-periods to prevent water evaporation and changes in the liquid parameters. On the phantom top, three reference markers are provided to identify the phantom position with respect to the robot.

<ELI4 Phantom>

Shell Thickness	2 ± 0.2 mm (sagging: <1%)	 <p>Fig 5.10 Photo of ELI4 Phantom</p>
Filling Volume	Approx. 30 liters	
Dimensions	Major ellipse axis: 600 mm Minor axis: 400 mm	

The ELI4 phantom is intended for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI4 is fully compatible with standard and all known tissue simulating liquids.

5.6 Device Holder

<Device Holder for SAM Twin Phantom>

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5 mm distance, a positioning uncertainty of ± 0.5 mm would produce a SAR uncertainty of ± 20 %. Accurate device positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

The DASY device holder is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear reference points). The rotation center for both scales is the ear reference point (EPR). Thus the device needs no repositioning when changing the angles.

The DASY device holder is constructed of low-loss POM material having the following dielectric parameters: relative permittivity $\epsilon = 3$ and loss tangent $\delta = 0.02$. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

Fig 5.11 Device Holder

<Laptop Extension Kit>

The extension is lightweight and made of POM, acrylic glass and foam. It fits easily on the upper part of the mounting device in place of the phone positioned. The extension is fully compatible with the SAM Twin and ELI phantoms.

Fig 5.12 Laptop Extension Kit

5.7 Data Storage and Evaluation

5.7.1 Data Storage

The DASY software stores the assessed data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all the necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files. The post-processing software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of erroneous parameter settings. For example, if a measurement has been performed with an incorrect crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be reevaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type (e.g., [V/m], [A/m], [mW/g]). Some of these units are not available in certain situations or give meaningless results, e.g., a SAR-output in a non-lose media, will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

5.7.2 Data Evaluation

The DASY post-processing software (SEMCAD) automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software :

Probe parameters :	- Sensitivity	Norm _i , a ₁₀ , a ₁₁ , a ₁₂
	- Conversion factor	ConvF _i
	- Diode compression point	dcp _i
Device parameters :	- Frequency	f
	- Crest factor	cf
Media parameters :	- Conductivity	σ
	- Density	ρ

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY components. In the direct measuring mode of the multi-meter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power.

The formula for each channel can be given as :

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

with V_i = compensated signal of channel i, (i = x, y, z)
 U_i = input signal of channel i, (i = x, y, z)
 cf = crest factor of exciting field (DASY parameter)
 dcp_i = diode compression point (DASY parameter)

From the compensated input signals, the primary field data for each channel can be evaluated :

$$\text{E-field Probes : } E_i = \sqrt{\frac{V_i}{\text{Norm}_i \cdot \text{ConvF}}}$$

$$\text{H-field Probes : } H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}$$

with V_i = compensated signal of channel i, (i = x, y, z)
 Norm_i = sensor sensitivity of channel i, (i = x, y, z), $\mu\text{V}/(\text{V/m})^2$ for E-field Probes
 ConvF = sensitivity enhancement in solution
 a_{ij} = sensor sensitivity factors for H-field probes
 f = carrier frequency [GHz]
 E_i = electric field strength of channel i in V/m
 H_i = magnetic field strength of channel i in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude) :

$$E_{\text{tot}} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$\text{SAR} = E_{\text{tot}}^2 \cdot \frac{\sigma}{\rho \cdot 1000}$$

with SAR = local specific absorption rate in mW/g
 E_{tot} = total field strength in V/m
 σ = conductivity in [mho/m] or [Siemens/m]
 ρ = equivalent tissue density in g/cm³

Note that the density is set to 1, to account for actual head tissue density rather than the density of the tissue simulating liquid.

5.8 Test Equipment List

Manufacturer	Name of Equipment	Type/Model	Serial Number	Calibration	
				Last Cal.	Due Date
SPEAG	Dosimetric E-Field Probe	ET3DV6	1787	May 26, 2009	May 25, 2010

Note: The calibration certificate of DASY can be referred to appendix C of this report.

6. Tissue Simulating Liquids

For the measurement of the field distribution inside the SAM phantom with DASY, the phantom must be filled with around 25 liters of homogeneous body tissue simulating liquid. For head SAR testing, the liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is larger than 15 cm, which is shown in Fig. 6.1. For body SAR testing, the liquid height from the center of the flat phantom to the liquid top surface is larger than 15 cm, which is shown in Fig. 6.2.

Fig 6.1 Photo of Liquid Height for Head SAR

Fig 6.2 Photo of Liquid Height for Body SAR

The following table gives the recipes for tissue simulating liquid.

Frequency (MHz)	Water (%)	Sugar (%)	Cellulose (%)	Salt (%)	Preventol (%)	DGBE (%)	Conductivity (σ)	Permittivity (ϵ_r)
For Head								
835	40.3	57.9	0.2	1.4	0.2	0	0.90	41.5
900	40.3	57.9	0.2	1.4	0.2	0	0.97	41.5
1800, 1900, 2000	55.2	0	0	0.3	0	44.5	1.40	40.0
2450	55.0	0	0	0	0	45.0	1.80	39.2
For Body								
835	50.8	48.2	0	0.9	0.1	0	0.97	55.2
900	50.8	48.2	0	0.9	0.1	0	1.05	55.0
1800, 1900, 2000	70.2	0	0	0.4	0	29.4	1.52	53.3
2450	68.6	0	0	0	0	31.4	1.95	52.7

Table 6.1 Recipes of Tissue Simulating Liquid

The following table gives the targets for tissue simulating liquid.

Frequency (MHz)	Liquid Type	Conductivity (σ)	$\pm 5\%$ Range	Permittivity (ϵ_r)	$\pm 5\%$ Range
2450	Head	1.80	1.71 ~ 1.89	39.2	37.2 ~ 41.2
5200	Head	4.66	4.43 ~ 4.89	36.0	34.2 ~ 37.8
5500	Head	4.96	4.71 ~ 5.21	35.6	33.8 ~ 37.4
5800	Head	5.27	5.01 ~ 5.53	35.3	33.5 ~ 37.1
2450	Body	1.95	1.85 ~ 2.05	52.7	50.1 ~ 55.3
5200	Body	5.30	5.04 ~ 5.57	49.0	46.6 ~ 51.5
5500	Body	5.65	5.37 ~ 5.93	48.6	46.2 ~ 51.0
5800	Body	6.00	5.70 ~ 6.30	48.2	45.8 ~ 50.6

Table 6.2 Targets of Tissue Simulating Liquid

The dielectric parameters of the liquids were verified prior to the SAR evaluation using an Agilent 85070D Dielectric Probe Kit and an Agilent Network Analyzer.

The following table shows the measuring results for simulating liquid.

Frequency (MHz)	Liquid Type	Temperature ($^{\circ}\text{C}$)	Conductivity (σ)	Permittivity (ϵ_r)	Measurement Date
2450	Head	21.5	1.84	38.7	Feb. 02, 2010
2450	Body	21.1	1.96	51.6	Feb. 02, 2010
2450	Body	21.3	1.93	53.6	Feb. 03, 2010
5200	Head	21.4	4.56	35.9	Jan. 30, 2010
5200	Body	21.2	5.34	47.5	Feb. 05, 2010

Table 6.3 Measuring Results for Simulating Liquid

7. Uncertainty Assessment

The component of uncertainty may generally be categorized according to the methods used to evaluate them. The evaluation of uncertainty by the statistical analysis of a series of observations is termed a Type A evaluation of uncertainty. The evaluation of uncertainty by means other than the statistical analysis of a series of observation is termed a Type B evaluation of uncertainty. Each component of uncertainty, however evaluated, is represented by an estimated standard deviation, termed standard uncertainty, which is determined by the positive square root of the estimated variance.

A Type A evaluation of standard uncertainty may be based on any valid statistical method for treating data. This includes calculating the standard deviation of the mean of a series of independent observations; using the method of least squares to fit a curve to the data in order to estimate the parameter of the curve and their standard deviations; or carrying out an analysis of variance in order to identify and quantify random effects in certain kinds of measurement.

A type B evaluation of standard uncertainty is typically based on scientific judgment using all of the relevant information available. These may include previous measurement data, experience and knowledge of the behavior and properties of relevant materials and instruments, manufacture’s specification, data provided in calibration reports and uncertainties assigned to reference data taken from handbooks. Broadly speaking, the uncertainty is either obtained from an outdoor source or obtained from an assumed distribution, such as the normal distribution, rectangular or triangular distributions indicated in Table 7.1

Uncertainty Distributions	Normal	Rectangular	Triangular	U-Shape
Multi-plying Factor ^(a)	$1/k^{(b)}$	$1/\sqrt{3}$	$1/\sqrt{6}$	$1/\sqrt{2}$

(a) standard uncertainty is determined as the product of the multiplying factor and the estimated range of variations in the measured quantity

(b) k is the coverage factor

Table 7.1 Standard Uncertainty for Assumed Distribution

The combined standard uncertainty of the measurement result represents the estimated standard deviation of the result. It is obtained by combining the individual standard uncertainties of both Type A and Type B evaluation using the usual “root-sum-squares” (RSS) methods of combining standard deviations by taking the positive square root of the estimated variances.

Expanded uncertainty is a measure of uncertainty that defines an interval about the measurement result within which the measured value is confidently believed to lie. It is obtained by multiplying the combined standard uncertainty by a coverage factor. Typically, the coverage factor ranges from 2 to 3. Using a coverage factor allows the true value of a measured quantity to be specified with a defined probability within the specified uncertainty range. For purpose of this document, a coverage factor two is used, which corresponds to confidence interval of about 95 %. The DASY uncertainty Budget is showed in Table 7.2 and Table 7.3.

Error Description	Uncertainty Value (±%)	Probability Distribution	Divisor	Ci (1g)	Standard Uncertainty (1g)
Measurement System					
Probe Calibration	5.5	Normal	1	1	± 5.5 %
Axial Isotropy	4.7	Rectangular	√3	0.7	± 1.9 %

Table 7.3 Uncertainty Budget of DASY for frequency range 3 GHz to 6 GHz

8. SAR Measurement Evaluation

Each DASY system is equipped with one or more system validation kits. These units, together with the predefined measurement procedures within the DASY software, enable the user to conduct the system performance check and system validation. System validation kit includes a dipole, tripod holder to fix it underneath the flat phantom and a corresponding distance holder.

8.1 Purpose of System Performance check

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results. The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.

8.2 System Setup

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave that comes from a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

Fig 8.1 System Setup for System Evaluation

1. Signal Generator
2. Amplifier
3. Directional Coupler
4. Power Meter
5. Calibrated Dipole

The output power on dipole port must be calibrated to 20 dBm (100 mW) before dipole is connected.

Fig 8.2 Photo of Dipole Setup

8.3 Validation Results

Comparing to the original SAR value provided by SPEAG, the validation data should be within its specification of 10 %. Table 8.1 shows the target SAR and measured SAR after normalized to 1W input power. The table below indicates the system performance check can meet the variation criterion and the plots can be referred to Appendix A of this report.

Measurement Date	Frequency (MHz)	Targeted SAR _{1g} (W/kg)	Measured SAR _{1g} (W/kg)	Deviation (%)
Feb. 02, 2010	2450	54.20	53.10	-2.03
Feb. 03, 2010	2450	53.00	50.60	-4.53
Jan. 30, 2010	5200	82.20	86.40	5.11
Feb. 05, 2010	5200	79.00	72.90	-7.72
Feb. 06, 2010	5200	79.00	76.40	-3.29
Feb. 07, 2010	5200	79.00	73.40	-7.09

Table 8.1 Target and Measurement SAR after Normalized

9. DUT Testing Position

This DUT was tested in seven different positions. They are right cheek, right tilted, left cheek, left tilted, face of the DUT with phantom 1.5 cm gap, bottom of the DUT with phantom 1.5 cm gap, and bottom of holster with the phantom 0 cm gap as illustrated below:

1. Define two imaginary lines on the handset

- (a) The vertical centerline passes through two points on the front side of the handset - the midpoint of the width w_t of the handset at the level of the acoustic output, and the midpoint of the width w_b of the bottom of the handset.
- (b) The horizontal line is perpendicular to the vertical centerline and passes through the center of the acoustic output. The horizontal line is also tangential to the face of the handset at point A.
- (c) The two lines intersect at point A. Note that for many handsets, point A coincides with the center of the acoustic output; however, the acoustic output may be located elsewhere on the horizontal line. Also note that the vertical centerline is not necessarily parallel to the front face of the handset, especially for clamshell handsets, handsets with flip covers, and other irregularly shaped handsets.

Fig 9.1 Illustration for Handset Vertical and Horizontal Reference Lines

2. Cheek Position

- (a) To position the device with the vertical center line of the body of the device and the horizontal line crossing the center piece in a plane parallel to the sagittal plane of the phantom. While maintaining the device in this plane, align the vertical center line with the reference plane containing the three ear and mouth reference point (M: Mouth, RE: Right Ear, and LE: Left Ear) and align the center of the ear piece with the line RE-LE.
- (b) To move the device towards the phantom with the ear piece aligned with the line LE-RE until the phone touched the ear. While maintaining the device in the reference plane and maintaining the phone contact with the ear, move the bottom of the phone until any point on the front side is in contact with the cheek of the phantom or until contact with the ear is lost (see Fig. 9.2).

Fig 9.2 Illustration for Cheek Position

3. Tilted Position

- (a) To position the device in the “cheek” position described above.
- (b) While maintaining the device the reference plane described above and pivoting against the ear, moves it outward away from the mouth by an angle of 15 degrees or until contact with the ear is lost (see Fig. 9.3).

Fig 9.3 Illustration for Tilted Position

4. Body Worn Position

- (a) To position the device parallel to the phantom surface with either keypad up or down.
- (b) To adjust the device parallel to the flat phantom.
- (c) To adjust the distance between the device surface and the flat phantom to 1.5 cm or bottom of holster and the flat phantom to 0 cm.

Fig 9.4 Illustration for Body Worn Position

5. DUT Setup Photos

Please refer to Appendix E for the test setup photos.

10. Measurement Procedures

The measurement procedures are as follows:

- (a) Use engineering software to transmit RF power continuously (continuous Tx) in the middle channel
- (b) Measure output power through RF cable and power meter
- (c) Place the DUT in the positions described in the last section
- (d) Set scan area, grid size and other setting on the DASY software
- (e) Taking data for the middle channel on each testing position
- (f) Find out the largest SAR result on these testing positions of each band
- (g) Measure SAR results for the lowest and highest channels in worst SAR testing position

According to the test standard, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- (a) Power reference measurement
- (b) Area scan
- (c) Zoom scan
- (d) Power drift measurement

10.1 Spatial Peak SAR Evaluation

The procedure for spatial peak SAR evaluation has been implemented according to the test standard. It can be conducted for 1g and 10g, as well as for user-specific masses. The DASY software includes all numerical procedures necessary to evaluate the spatial peak SAR value.

The base for the evaluation is a "cube" measurement. The measured volume must include the 1g and 10g cubes with the highest averaged SAR values. For that purpose, the center of the measured volume is aligned to the interpolated peak SAR value of a previously performed area scan.

The entire evaluation of the spatial peak values is performed within the post-processing engine (SEMCAD). The system always gives the maximum values for the 1g and 10g cubes. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- (a) Extraction of the measured data (grid and values) from the Zoom Scan
- (b) Calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- (c) Generation of a high-resolution mesh within the measured volume
- (d) Interpolation of all measured values from the measurement grid to the high-resolution grid
- (e) Extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- (f) Calculation of the averaged SAR within masses of 1g and 10g

10.2 Scan Procedures

First Area Scan is used to locate the approximate location(s) of the local peak SAR value(s). The measurement grid within an Area Scan is defined by the grid extent, grid step size and grid offset. Next, in order to determine the EM field distribution in a three-dimensional spatial extension, Zoom Scan is required. The Zoom Scan measures 5x5x7 points with step size 8, 8 and 5 mm for 300 MHz to 3 GHz, and 8x8x8 points with step size 4.3, 4.3 and 3 mm for 3 GHz to 6 GHz. The Zoom Scan is performed around the highest E-field value to determine the averaged SAR-distribution over 10 g.

10.3 SAR Averaged Methods

In DASy, the interpolation and extrapolation are both based on the modified Quadratic Shepard's method. The interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. The uncertainty increases with the extrapolation distance. To keep the uncertainty within 1% for the 1 g and 10 g cubes, the extrapolation distance should not be larger than 5 mm.

#102	802.11a with Bluetooth on	Right Cheek	149	Numeric	0.122

11.3 Test Records for Body SAR Test

<1> DUT with Flat Phantom 1.5 cm Gap

Plot No.	Mode	Test Position	Separation Distance (cm)	Channel	Keypad	SAR _{1g} (W/kg)
#51	802.11b	Bottom of the DUT	1.5	6	Qwerty	0.019
#52	802.11b	Bottom of the DUT	1.5	6	Numeric	0.018
#53	802.11g	Bottom of the DUT	1.5	6	Qwerty	0.03
#54	802.11g	Face of the DUT	1.5	6	Qwerty	0.045
#55	802.11g	Face of the DUT	1.5	1	Qwerty	0.016
#56	802.11g	Face of the DUT	1.5	11	Qwerty	0.018
#57	802.11g	Face of the DUT	1.5	12	Qwerty	0.00283
#58	802.11g	Face of the DUT	1.5	13	Qwerty	0.013
#59	802.11g	Face of the DUT with Bluetooth On	1.5	6	Qwerty	0.041
#60	802.11a	Bottom of the DUT	1.5	36	Qwerty	0.047
#61	802.11a	Bottom of the DUT	1.5	36	Numeric	0.048
#62	802.11a	Face of the DUT	1.5	36	Numeric	0.057
#63	802.11a	Face of the DUT	1.5	48	Numeric	0.118
#64	802.11a	Face of the DUT with Bluetooth On	1.5	48	Numeric	0.116
#65	802.11a	Bottom of the DUT	1.5	52	Qwerty	0.073
#66	802.11a	Bottom of the DUT	1.5	52	Numeric	0.084
#67	802.11a	Face of the DUT	1.5	52	Numeric	0.12
#68	802.11a	Face of the DUT	1.5	64	Numeric	0.083
#69	802.11a	Face of the DUT with Bluetooth On	1.5	52	Numeric	0.116
#70	802.11a	Bottom of the DUT	1.5	104	Qwerty	0.036
#71	802.11a	Bottom of the DUT	1.5	104	Numeric	0.037
#72	802.11a	Face of the DUT	1.5	104	Numeric	0.038
#73	802.11a	Face of the DUT	1.5	116	Numeric	0.071
#74	802.11a	Face of the DUT	1.5	124	Numeric	0.065
#75	802.11a	Face of the DUT	1.5	136	Numeric	0.026
#76	802.11a	Face of the DUT with Bluetooth On	1.5	116	Numeric	0.075
#77	802.11a	Bottom of the DUT	1.5	149	Qwerty	0.047
#78	802.11a	Bottom of the DUT	1.5	149	Numeric	0.045
#79	802.11a	Face of the DUT	1.5	149	Qwerty	0.062
#80	802.11a	Face of the DUT	1.5	157	Qwerty	0.056
#81	802.11a	Face of the DUT	1.5	161	Qwerty	0.056
#82	802.11a	Face of the DUT	1.5	165	Qwerty	0.064
#83	802.11a	Face of the DUT with Bluetooth On	1.5	165	Qwerty	0.073

<2> Holster 1 Touching with Flat Phantom 0 cm Gap

Plot No.	Band	Test Position	Separation Distance (cm)	Channel	Keypad	SAR _{1g} (W/kg)
#45	802.11b	Face of the DUT	0	6	Qwerty	0.12
#46	802.11b	Face of the DUT	0	6	Numeric	0.101
#47	802.11g	Face of the DUT	0	6	Qwerty	0.152
#48	802.11g	Face of the DUT	0	1	Qwerty	0.069
#49	802.11g	Face of the DUT	0	11	Qwerty	0.05
#50	802.11g	Face of the DUT	0	12	Qwerty	0.00979
#51	802.11g	Face of the DUT	0	13	Qwerty	0.047
#52	802.11g with Bluetooth On	Face of the DUT	0	6	Qwerty	0.142
#53	802.11a	Face of the DUT	0	36	Qwerty	0.03
#54	802.11a	Face of the DUT	0	36	Numeric	0.025
#55	802.11a	Face of the DUT	0	48	Qwerty	0.113
#56	802.11a with Bluetooth On	Face of the DUT	0	48	Qwerty	0.142
#57	802.11a	Face of the DUT	0	52	Qwerty	0.1
#58	802.11a	Face of the DUT	0	52	Numeric	0.11
#59	802.11a	Face of the DUT	0	64	Numeric	0.071
#60	802.11a with Bluetooth On	Face of the DUT	0	52	Numeric	0.143
#61	802.11a	Face of the DUT	0	104	Qwerty	0.03
#62	802.11a	Face of the DUT	0	104	Numeric	0.029
#63	802.11a	Face of the DUT	0	116	Qwerty	0.041
#64	802.11a	Face of the DUT	0	124	Qwerty	0.04
#65	802.11a	Face of the DUT	0	136	Qwerty	0.021
#66	802.11a with Bluetooth On	Face of the DUT	0	116	Qwerty	0.048
#67	802.11a	Face of the DUT	0	149	Qwerty	0.025
#68	802.11a	Face of the DUT	0	149	Numeric	0.027
#69	802.11a	Face of the DUT	0	157	Numeric	0.031
#70	802.11a	Face of the DUT	0	161	Numeric	0.039
#71	802.11a	Face of the DUT	0	165	Numeric	0.1
#72	802.11a with Bluetooth On	Face of the DUT	0	165	Numeric	0.1

Note: Holster 1 can only allow for face position.

<3> Holster 2 Touching with Flat Phantom 0 cm Gap

Plot No.	Band	Test Position	Separation Distance (cm)	Channel	Keypad	SAR _{1g} (W/kg)
#51	802.11b	Bottom of the DUT	0	6	Qwerty	0.017
#52	802.11b	Bottom of the DUT	0	6	Numeric	0.017
#53	802.11g	Bottom of the DUT	0	6	Qwerty	0.026
#54	802.11g	Face of the DUT	0	6	Qwerty	0.035
#55	802.11g	Face of the DUT	0	1	Qwerty	0.011
#56	802.11g	Face of the DUT	0	11	Qwerty	0.013
#57	802.11g	Face of the DUT	0	12	Qwerty	0.00346
#58	802.11g	Face of the DUT	0	13	Qwerty	0.01
#59	802.11g with Bluetooth On	Face of the DUT	0	6	Qwerty	0.03
#60	802.11a	Bottom of the DUT	0	36	Qwerty	0.065
#61	802.11a	Bottom of the DUT	0	36	Numeric	0.075
#62	802.11a	Face of the DUT	0	36	Numeric	0.049
#63	802.11a	Bottom of the DUT	0	48	Numeric	0.118
#64	802.11a with Bluetooth On	Bottom of the DUT	0	48	Numeric	0.129
#65	802.11a	Bottom of the DUT	0	52	Qwerty	0.112
#66	802.11a	Bottom of the DUT	0	52	Numeric	0.136
#67	802.11a	Face of the DUT	0	52	Numeric	0.082
#68	802.11a	Bottom of the DUT	0	64	Numeric	0.115
#69	802.11a with Bluetooth On	Bottom of the DUT	0	52	Numeric	0.141
#70	802.11a	Bottom of the DUT	0	104	Qwerty	0.052
#71	802.11a	Bottom of the DUT	0	104	Numeric	0.052
#72	802.11a	Face of the DUT	0	104	Qwerty	0.038
#73	802.11a	Bottom of the DUT	0	116	Qwerty	0.065
#74	802.11a	Bottom of the DUT	0	124	Qwerty	0.093
#75	802.11a	Bottom of the DUT	0	136	Qwerty	0.055
#76	802.11a with Bluetooth On	Bottom of the DUT	0	116	Qwerty	0.089
#77	802.11a	Bottom of the DUT	0	149	Qwerty	0.067
#78	802.11a	Bottom of the DUT	0	149	Numeric	0.074
#79	802.11a	Face of the DUT	0	149	Numeric	0.062
#80	802.11a	Bottom of the DUT	0	157	Numeric	0.077
#81	802.11a	Bottom of the DUT	0	161	Numeric	0.068
#82	802.11a	Bottom of the DUT	0	165	Numeric	0.075
#83	802.11a with Bluetooth On	Bottom of the DUT	0	157	Numeric	0.082

Test Engineer : Gordon Lin and Eric Huang and Robert Liu and A-Rod Chen
