## DFS client device channel plan and software operational declaration

We, **Kyocera Corporation**, declare that this device, **FCC ID: V65C6930**, does not have an Ad Hoc mode on non-US frequencies and/or on DFS frequencies. Also, the client software and associated drivers will not initiate any transmission on DFS frequencies without initiation by a master. This includes restricting the transmission of beacons and support for ad-hoc peer-to-peer modes.

Below is the channel / frequency plan for the device

On DFS channels, the WLAN driver in the device operates under the control of an AP at all times, and the WLAN driver does not support ad-hoc mode on DFS channels. The device passively scans DFS frequencies until a master device is detected. The control of this functionality is not accessible to anyone under any conditions. Furthermore, the firmware is protected by special signature and CRC checksum. Signature and CRC checksum will be calculated and verified before firmware upgrade. Unauthorized modification to firmware will lead the failure of verification thus firmware upgrade is not allowed.

Sincerely yours,

Douglas Dunn Deputy General Manager Regulatory Affairs
