# 1. Electromagnetic simulation method for power density

## 1.1 EM simulation tool

### 1.1.1 EM simulation tool description

The mmWave power density (PD) simulation method for calculating PD for mobile phones with mmWave antenna modules is available in ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2) is used. ANSYS HFSS is one of several commercial tools for 3D full-wave electromagnetic simulation used for antenna and RF structure design of high frequency component. ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2) is implemented based on Finite Element Method (FEM), which operates in the frequency domain.

### 1.1.2 Mesh and convergence criteria

ANSYS Electromagnetic suite HFSS ver. 20.2(2020 R2) uses the FEM to solve the structure for 3D EM simulations to analyze power density. The volume area containing the simulated object should be subdivided into electrically small parts called finite elements with unknown functions. To subdivide system, the adaptive mesh technique in ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2) is used. ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2) starts to refine the initial mesh based on wavelength and calculate the error to iterative process for adaptive mesh refinement. The determination parameter of the number of iteration in ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2) is defined as convergence criteria, delta S, and the iterative adaptive mesh process repeats until the delta S is met. In ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2), the accuracy of converged results depends on the delta S.

### 1.1.3 Time-averaged power density calculation

It is possible to get various kinds of physical quantities can be obtained after finishing 3D full-wave electromagnetic simulation. To calculate PD evaluation, two physical quantities, an electric field ( $\vec{E}$ ) and a magnetic field ( $\vec{H}$ ) are needed. The actual consumption power can be expressed as the real term of the time-averaged Poynting vector ( $\vec{S}$ ) from the cross product of  $\vec{E}$  and complex conjugation of  $\vec{H}$  as shown below:

$$(\vec{S}) = \operatorname{Re} \left( \frac{1}{2} \vec{E} \times \vec{H}^* \right)$$

( $\vec{S}$ ) can be expressed as point power density based on a peak value of each spatial point on mesh grids, and obtained directly from ANSYS Electromagnetics suite HFSS ver. 20.2(2020 R2) .

From the point power density ( $\vec{S}$ ), the spatial-averaged power density ( $PD_{av}$ ) on an evaluated area (A) can be derived as shown below:

$$PD_{av} = \frac{1}{A} \int_A (\vec{S}) \cdot ds = \frac{1}{2A} \int_A |\operatorname{Re}(\vec{E} \times \vec{H})| \cdot ds ,$$

where the spatial-averaged power density  $PD_{av}$  is total power density value considering on x, y and z components of point power density ( $\vec{S}$ ) and the evaluated are (A) is  $4cm^2$ .

## 1.2 Simulation setup

### 1.2.1 Modeling for simulation

The simulation approach to perform PD assessment for a smartphone requires accurate modeling for mmWave antenna module as well as the smartphone itself. Figure 1 shows the simulation model which is mounted two mmWave antenna modules. The simulation modeling includes most of the entire structure of device itself such as PCB, metal frame, battery, large components and legacy antennas as well as mmWave antenna modules QTM#0 and QTM#1. On the back front view, QTM#0 is placed on the left side and antennas are facing the left side of the device. QTM#1 is placed on the top side and antennas are facing the back side of the device.

Figure 1. HFSS simulation model which is mounted two mmWave antenna modules.

### 1.2.2 PD evaluation surfaces

Table 1 shows the PD evaluation surfaces for each mmWave antenna module and Figure 2 shows the PD evaluation planes and truncation area of the simulation model to find worst case of beam forming cases. In these cases, 5 PD evaluation surfaces except bottom side are set up. QTM#0 and QTM#1 are placed at the top of the device and the bottom side is excluded from the worst case because the distance from the bottom side is more than  $10\lambda$  at 28GHz and 39GHz.

Table 1. PD evaluation surfaces

MODULE	Front	Back	Right	Left	Top	Bottom
QTM#0	○	○	○	○	○	×
QTM#1	○	○	○	○	○	×

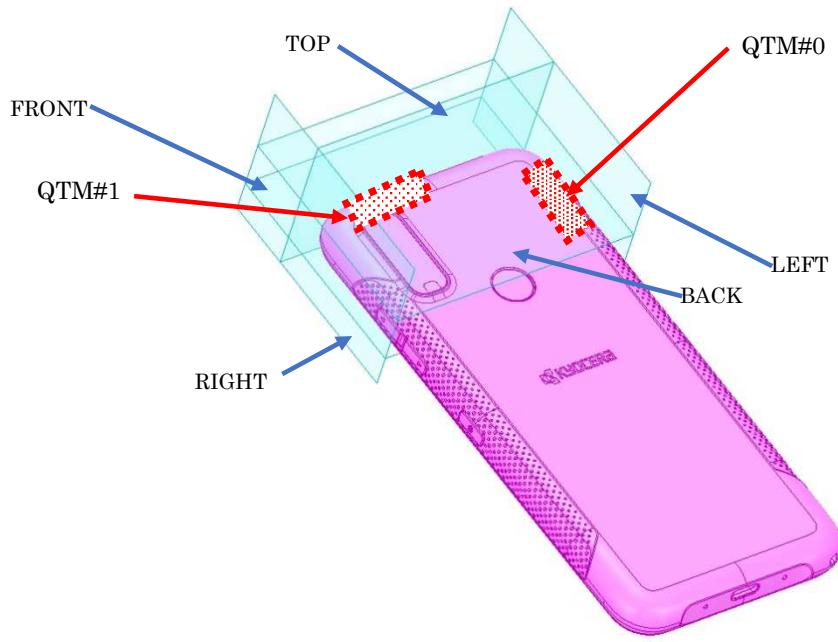

Figure 2. PD evaluation Surfaces

### 1.2.3 Radiation boundary condition

For radiation boundary, the 2nd order absorbing boundary condition (ABC) is used for all simulations in this report. This radiation boundary simulates an electrically open surface that allows waves to radiate infinitely far into space the system absorbs the wave via the 2nd order radiation boundary, essentially ballooning the boundary infinitely far away from the structure and into space. The radiation boundaries may also be placed relatively close to a structure and can be of arbitrary shape.

Per ANSYS recommendations for their simulation tool, the radiation boundary plane must be located at least a quarter wavelength from strongly radiating structure, or at least a tenth of a wavelength from a weakly radiating structure. In this simulation report, about 3 wavelengths spacing from the device surfaces in all main beam directions are applied to ensure convergence. By changing convergence error (i.e., maximum magnitude delta S) from 2% to 4% and moving the radiation boundary closer towards the device by 20%, the combined influence in PD value is < 0.04dB which confirms that the simulation model is reliable using this setup.

### 1.2.4 Source excitation condition

Each of the two 5G mmWave array modules is the same part containing a 1x4 element array of dual-polarization patch antennas. The number of antenna ports of QTM#0 and QTM#1 for source excitation is equal to 16. The port of each patch antenna are separated in frequency and polarization. That is, the ports of each patch antenna are divided into a feed for 28 GHz and a feed for 39 GHz, and

a vertical polarity feed and a horizontal polarity feed are divided.

Figure 3 shows the QTM#1 module structure and surrounding structure. The QTM#1 module is encrypted in the ANSYS Electromagnetics suite (HFSS) and can only check the feeding position.

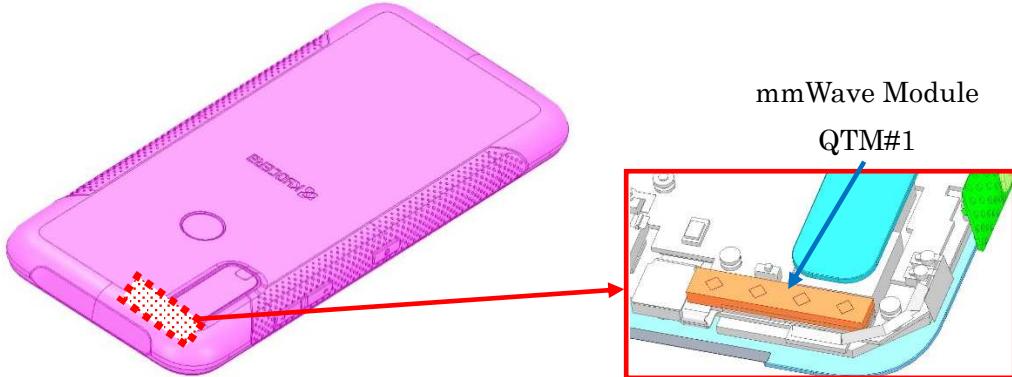

Figure 3. mmWave module

After finishing 3D full wave electromagnetic simulation of modeling structure, the magnitude and phase information can be loaded for each port by using “Edit Sources” function in ANSYS Electromagnetics suite (HFSS). Figure 4 shows an example of antenna port excitations.

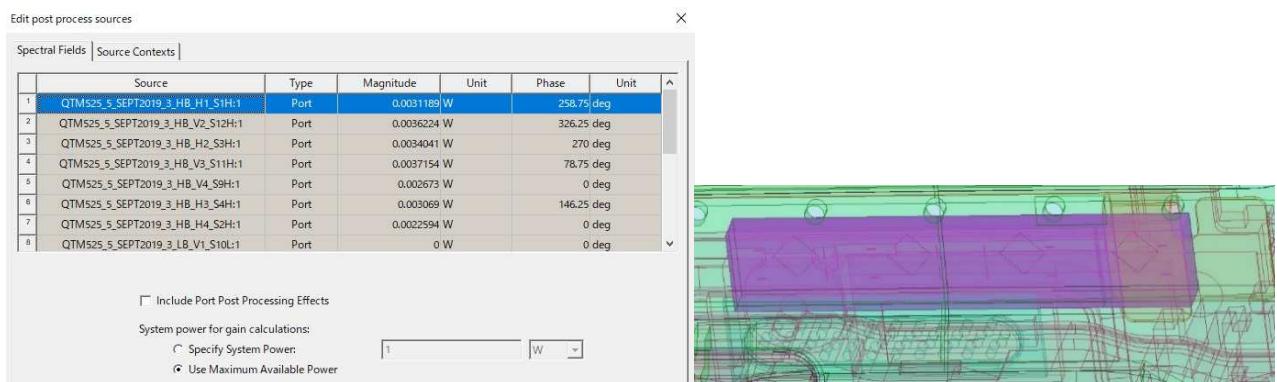

Figure 4. An example of port excitation (QTM#1)

Since ANSYS Electromagnetics suite (HFSS) uses FEM solver based on frequency domain analysis method, the input source for the port excitation applies sinusoidal waveform for each frequency.

### 1.2.5 Condition of simulation completion

The simulation completion condition of ANSYS Electromagnetics suite (HFSS) is defined as delta S. The ANSYS Electromagnetics suite (HFSS) calculates the S-parameter for the mesh conditions of each step and determines whether to proceed with the operation of the next step by comparing the difference between the S-parameters in the previous step. A difference between the previous step and the current step of S-parameter is expressed as delta S, and the delta S generally set 0.02. The simulation result of this report is the result of setting delta S to 0.02.

## 2. Simulation verification

### 2.1 Spatial-averaged power density

As mentioned in the previous chapter, the Poynting vector ( $\vec{S}$ ) can be obtained through cross product of an electric field ( $\vec{E}$ ) and complex conjugate of a magnetic field ( $\vec{H}$ ). The real term of the Poynting vector can be described as the point power density or peak power density. Using the point power density, the spatial-averaged power density can be obtained by the integral of  $4\text{cm}^2$  at 2.5 mm intervals of the point power density result. Figure 5 shows examples of the distribution plot of point power density and the averaged power density.

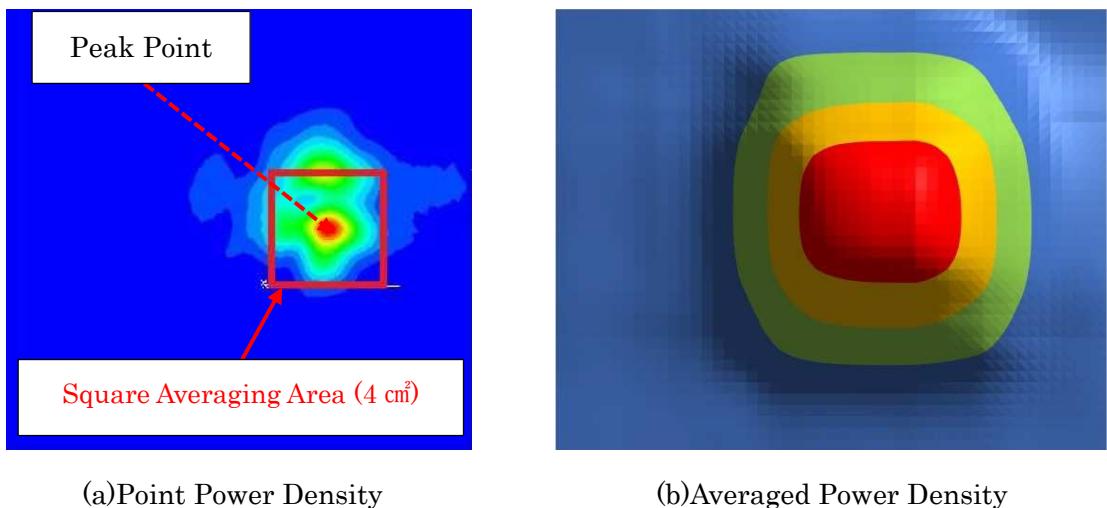

Figure 5. Power density distribution (Example)

## 2.2 Comparison between simulation and measurement

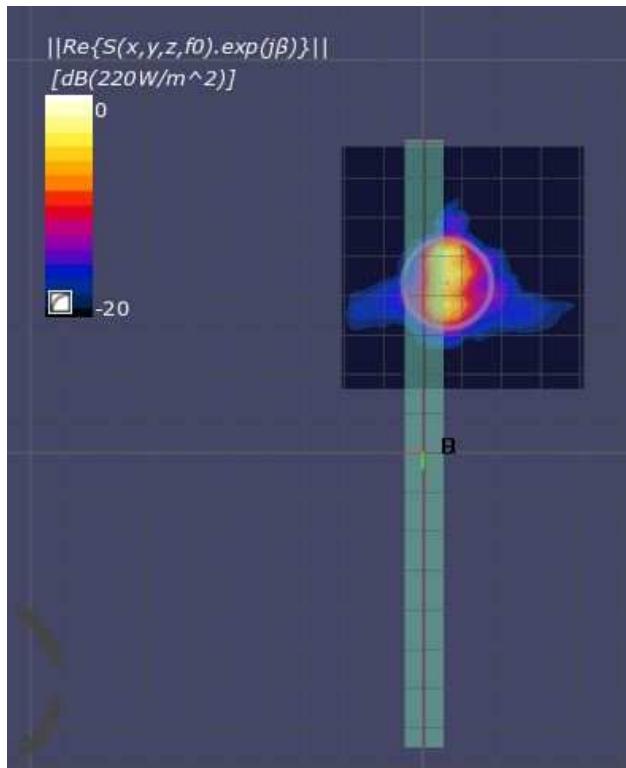

In this section, the simulated and measured power density distributions are compared with each mmWave antenna. Based on the comparison of the power density distribution, the simulated power density and the measured power density have a good correlation. The amplitude mismatch between the simulated  $4\text{cm}^2$  average power density and the measured  $4\text{cm}^2$  average power density is considered a housing influence. Input power per each active port is listed below for both simulation and measurement verification and power density characterization. For simulation, these values were entered directly into the HFSS model. For measurement, it was used to input these values for each active port using Factory Test Mode S/W.

Mode/Band	Antenna	Input Power (dBm) SISO	Input Power (dBm) MIMO
5G NR n261 (28GHz)	QTM#0 Patch	6.0	6.0
	QTM#1 Patch	6.0	6.0
5G NR n260 (39GHz)	QTM#0 Patch	6.0	6.0
	QTM#1 Patch	6.0	6.0

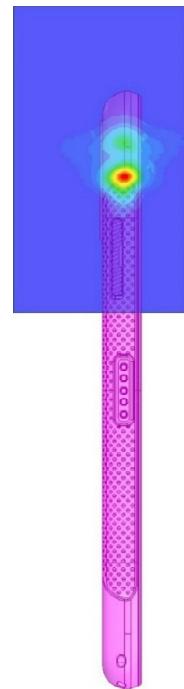

The simulation and measurement results below were performed at 2mm evaluation distance and 28 GHz / 39GHz.

6dBm input measurement/ simulation							$4\text{cm}^2$ avg.PD (mW/cm <sup>2</sup> )		$\Delta$ (dB)	$\Delta_{\min}$ (dB)

## Simulation results

This section shows the PD simulation results of QTM#0 and QTM#1 at 28GHz and 39GHz for each evaluation surface specified in Table 1 at 2mm distance.

The relative phase between beam pairs is not controlled in the chipset design. Therefore, the relative phase between each beam pair was considered mathematically to identify the worst case conditions. The below tables MIMO results represent worst case of MIMO. After sweeping the relative phase between beams at  $5^\circ$  intervals from  $0^\circ$  to  $360^\circ$ , the highest value is attached to the MIMO simulation results.

## **2.3 PD for Low/Mid/High Channel at 28GHz / 39GHz**

### **2.3.1 QTM#0 – Patch Antenna**

Table 2 & Table 3 show the PD simulation evaluation of QTM#0 patch antenna at 28GHz / 39GHz for the corresponding evaluation surface specified in Table 1.

Table 2. PD of QTM#0 – patch antenna (28GHz)

### 2.3.2 QTM#1 – Patch Antenna

Table 4 & Table 5 show the PD simulation evaluation of QTM#1 patch antenna at 28GHz / 39GHz for the corresponding evaluation surface specified in Table 1.

Table 4. PD of QTM#1 – patch antenna (28GHz)

QTM#1 Low Ch
