On DFS channels, the WLAN driver in the device operates under the control of an AP at all times. The device passively scans DFS frequencies until a master device is detected. The control of this functionality is not accessible to anyone under any conditions. Furthermore, the firmware is protected by a special signature and CRC checksum. The signature and CRC checksum will be calculated and verified before a firmware upgrade is allowed. Attempts at unauthorized modification to firmware will lead the failure of the verification, thus the firmware upgrade will not be allowed.

Sincerely yours,
