## 7 CARRIER FREQUENCY SEPARATION

### 7.1 Test Configuration

**FCC:** § 15.247 a1

**IC:** RSS-210 §A8.1(2)

The Bluetooth transmitter was set in hopping mode to investigate the carrier frequency separation between mid-channel and its adjacent channels. The carrier frequency separation is independent of modulation and packet length (DH1, DH3, etc.).

**Limits:**

a)  $\geq 25$  kHz or 20 dB Bandwidth, whichever is greater

b) For FH systems operating in 2400-2483.5MHz and with output power less than 125mW the carrier frequency separation should be greater than 25kHz or 2/3 of 20dB Bandwidth.

### 7.2 Results: Carrier Frequency

Figure	Frequency Separation	Limits > 2/3 of 20 dB Bandwidth	Result
7	1.005 GHz	853 kHz $(2/3) * 1.28 \text{ MHz} = 853.3 \text{ kHz}$	Pass

**Figure 7: Carrier Frequency Separation between channels 38, 39 (mid-channel) & 40.**

## 8 NUMBER OF HOPPING FREQUENCIES

### 8.1 Test Configuration

<b>FCC:</b> § 15.247 a1 iii
<b>IC:</b> RSS-210 §A8.1 (4)

The Bluetooth transmitter was set in hopping mode to investigate the number of hopping frequencies. The number of frequency hopping is independent of modulation and packet length (DH1, DH3, etc.).

**Limits:**

At least 15 non-overlapping channels

### 8.2 Results: Number of Hopping Frequencies

Figure	Channel	Plot Description	Results
8a	Hopping	Number of Hopping Frequencies (Channels 0-39)	79
8b		Number of Hopping Frequencies (Channels 39-78)	(Channels 0-78)

## 9 TIME OF OCCUPANCY (DWELL TIME)

### 9.1 Test Configuration

<b>FCC:</b>	<b>§ 15.247 a1 iii, § 15.247 f</b>
<b>IC:</b>	<b>RSS-210 §A8.1 (4)</b>
<p>The Bluetooth transmitter was set in hopping mode to capture one of the transmissions of mid-channel. Mid-channel (CH 39) was measured here.</p> <p>Comments:          The dwell time is independent of modulation and packet length (DH1, DH3, etc.).</p> <p>According to the Bluetooth Core Specification v1.1, we have 1600 hops in a second for a one slot packet type. One frequency hop lasts 625 μs; this increment is called a time slot. In a period of 31.6 seconds, the time of occupancy for any given channel is calculated as follows:</p> <p>Duration of one transmission*(1600 hops/sec)/(No. of time-slots)/(79 channels)*31.6 sec</p> <p>For a DH1 (1 time-slot) packet type, ideally the duration of one transmission is 625 μs. Therefore, the dwell time is given by:</p> <p><math>625 \mu\text{s} * 1600 / \text{s} / (1 \text{ time-slot}) / 79 * 31.6 \text{ s} = 0.4 \text{ s}.</math></p> <p><u>Spectrum Analyzer Parameters:</u>          The measurement is conducted with zero span centered at mid-channel (2441 MHz) with sweep time sufficient enough to capture one transmission (in this case, ≥ 625 μs).</p> <p><b>Limits:</b>          ≤ 0.4 s          (in a period of 31.6 s)</p>	

### 9.2 Results: Dwell Time

Figure	Channel	Results
9	Hopping	0.2387s

## 10 BANDEDGE

### 10.1 Test Configuration

**FCC:** § 15.247 d

**IC:** RSS-210 §A8.5

The Bluetooth RF output port of the EUT was directly connected to the input of the spectrum analyzer with sufficient attenuation. Subsequently, the low and high channels of Bluetooth transmitter were enabled separately to investigate the band-edge compliance of conducted emissions. To ensure the band-edge compliance when the channels are hopping, measurements were also conducted at low and high channels in this mode. A fully charged battery was used as supply voltage

Frequencies of Interest: Spectrum was investigated from 2400 MHz – 2483.5 MHz.

Limits: ≤ -20 dBc

In any 100kHz band, the highest radio frequency power outside the band (2400-2483.5 MHz) is measured to be at least 20 dB below the desired power of intentional radiator within the band.
