Chapter 1 Product Overview

1 Package Contents

Please verify that the package contains the following items:

- Wireless Router
- Power Adapter
- Installation Guide
- Ethernet Cable
- Resource CD

If any of the above items are incorrect, missing, or damaged, please contact your Tenda reseller for immediate replacement.

2 Getting to Know Your Router

Front LED Overview

LED	Status	Description
Power	Solid	Indicates a proper connection to power supply
	Off	Indicates an improper connection to power supply
cvc	Blinking	Indicates the system is functioning correctly
515	Solid/Off	Indicates the system is functioning incorrectly
WPS	Blinking	Device is performing WPS authentication on a client device
	Off	WPS is disabled or WPS authentication finished
	Solid	WiFi is enabled
WiFi	Blinking	Transmitting data
	Off	WiFi is disabled
	Solid	LAN port connected correctly
LAN (3/2/1)	Blinking	LAN port is transmitting data
	Off	LAN port connected incorrectly
LAN 1	Solid	IPTV port is correctly connected
/IPTV	Blinking	IPTV port is transmitting data
	Off	IPTV port is incorrectly connected
	Solid	WAN port connected correctly
VVAN	Blinking	WAN port is transmitting data
	Off	WAN port connected incorrectly
	Solid	Indicates the USB port is correctly connected
USB	Off	Indicates the USB port is incorrectly connected

Back Panel

- 1. **WPS/Reset:** WPS button/Reset button: Pressing it for about 3 second enables WPS encryption with a blinking WPS LED while pressing it for about 7 seconds restores the router to its factory default setting.
- 2. USB: USB port for connection to a USB device such as a USB printer or data storage device.
- 3. **WAN:** Internet port (RJ-45) for connection to an Internet-enabled DSL Modem/Cable Modem or existing Ethernet.
- 4. LAN/1/2/3: 3 LAN ports (RJ-45) for connection to PC's NIC or uplink to a hub, switch or wireless AP.

LAN 1/IPTV: IPTV port for connection to a network set-top box. However, this port can also function as a LAN port if the IPTV STB option is not enabled.

- 5. **PWR:** The power adapter is connected and you can use the provided adapter to supply power.
- 6. WiFi: WiFi button, pressing it disables wireless. WiFi is enabled by default.

Label

	Tenda	MADE IN CHINA www.tendacn.com
1 2 3	Wireless N450 Giga Model: F452 IP Address: 192.168.0.1 Password: admin Power: 12V1.5A	Abit Router FCC ID:V/TF452 FCC ID:V/TF452
4	МАС	
5	Wireless Network, Name(SSID)	
	Serial No.	

You can acquire the following information from Label:

- 1. Model: Displays the product model.
- 2. IP Address: The default IP is 192.168.0.1
- 3. Password: The default password is admin.
- 4. MAC Address: Displays the device's default MAC address.
- 5. SSID: Displays the device's default SSID name.

3 Position Your Router

For best performance, please place your router:

- Near the center of the area where your computers and other devices operate, and preferably within line of sight to your wireless devices.
- Accessible to an AC power outlet and near Ethernet cables for wired computers.
- In an elevated location such as a high shelf, keeping the number of walls and ceilings between the router and your other devices to a minimum.
- Away from electrical devices that are potential sources of interference, such as ceiling fans, home security systems, microwaves, PCs, the base of a cordless phone, or a 2.4-GHz cordless phone.
- Away from any large metal surfaces, such as a solid metal door or aluminum studs. Large expanses of other materials such as glass, insulated walls, fish tanks, mirrors, brick, and concrete can also affect your wireless signal.

Chapter 2 Installation and Quick Setup Guide

1 Preparation

Before connecting Ethernet cables, please verify the following items:

Item	Description
Wireless Router	Used with the provided power supply
PC	Installed with IE8 or other better web browsers.
Ethernet Cable	Used for linking the PC to the router
Broadband	Provided by ISP
Service	
	• If you connect to the Internet using a broadband connection that
Internet	requires a username and a password provided by your ISP, please
Connection	select PPPoE;
Туре	• If you can access Internet as soon as your computer directly connects
	to an Internet-enabled ADSL/Cable modem, please select Dynamic IP.

2 Hardware Installation

1. Connect one end of the included power adapter to the router and plug the other end into a surge protected power strip. (Using a power adapter with a different voltage rating than the one included with the router will cause damage to the router.)

2. Connect one of the LAN ports on the router to the RJ45 (NIC) port on your PC using an Ethernet cable.

3. Connect the Ethernet cable from the incoming Internet side to the WAN port on the router.

3 Internet Connection Setup

Configure PC

Configure your PC obtain IP address automatically. If you are not clear about this, please refer to Appendix 1

Configure PC.

Configure Router

Login to Web Utility

1. Launch a web browser, such as IE Web browser;

2. In the address bar, input 192.168.0.1 and press Enter;

3. Enter a password in the corresponding field as shown in the window below (the default is set to "admin").

F Series Wireless Router					
Password	Login	Cancel	(Default:admin)		

∧_{Note}

For security purpose, please change the default password after you have logged in to the web utility.

Internet Connection Setup

Common Internet connection types are available on the home page: PPPoE and Dynamic IP.

Tenda	1946	Version Product Name	VI 0.0.0,0,17192) F Series Wreless Romer
Interliet Connection Setup			
Internet Connection Type	PPPoE Oynamic IP		
	For other connection types, click "Advanced"		
Wireless Security Setup			
2.4G WiFi			
	(Default: 12345678)		
	Save Cancel		

PPPoE

Select PPPoE (Point to Point Protocol over Ethernet) if you used to connect to the Internet using a broadband connection that requires a username and a password. Enter the user name and password provided by your ISP; configure a security key to secure your wireless network and then click OK.

Tenda		Version V1.0.0,0_en (71.02) Product Name F Senes Wireless Touter
Internet Connection Setup Internet Connection Type ISP Username ISP Password	PPPoE O Dynamic IP Please enter ISP Username Please enter ISP Password For other connection types, click "Advanced"	
Wireless Security Setup		
	(Default: 12345678)	
	Save Cancel	

Dynamic IP

Select DHCP (Dynamic IP) if you can access Internet as soon as your computer directly connects to an Internet-enabled ADSL/Cable modem; configure a security key (8-63 characters) to secure your wireless network and then click OK.

Tenda	1850	Version VI (0.0.aut (7102) Product Name (7.5eries Wireless Roun
Internet Connection Setup Internet Connection Type	PPPoE Dynamic IP For other connection types, click "Advanced"	
Wireless Security Setup		
2,4G WiFi	•••••	
	(Default: 12345678)	
	Save Cancel	

∆_{Note}

Tenda

1. DHCP is the default Internet connection type;

2. If you are not sure about your PPPoE username and password, contact your Internet service provider (ISP) for help. For other Internet connection types, please go to section <u>2.2: WAN</u>.

4 Verify Internet Connection Settings

System automatically skips to the status page when you finish all needed settings on the home page. Here you can see the system status and WAN connection status of the device.

1. If you find **Connected** and a WAN IP address displayed there (as shown below), you have got a wired internet access now.

Tenda		R				Versic Produ
ſ	Home	Status	Network	Wireless	Advanced	USB
System Status		AN Status				
WAN Status		WAN Medium Typ	e Wired WAN			
LAN Status		Connection Typ	e Dynamic IP			
Wireless Status		Connection Statu	s Connected			
Connection Status		MAC Addres	s 00:90:4C:	0F:F1:1F		
		IP Addres	is 10.0.1.1			
		Subnet Mas	k 255.0.0.0			
		Gatewa	iy 10.0.0.25	4		
		Primary DNS Serve	er 10.0.0.25	4		
		Secondary DNS Serve	er 8.8.8.8			
		Up Tim	e 0Day(s)00	:13:58		
			Rele	ease Refre:	sh	

2. If connection status displays **Cable improperly connected** and there is no WAN IP address displayed (as seen below), connection between the Internet-enabled modem and your device may have failed. Please double check or re-connect all involved devices and cables properly and then refresh the page. If nothing is

wrong, Connecting or Connected will be displayed.

Tenda	3					Versio Produ
	Home	Status	Network	Wireless	Advanced	US8
System Status		AN Status				
WAN Status		WAN Medium Ty	pe Wired WAN			
LAN Status		Connection Ty	pe Dynamic IP			
Wireless Status		Connection Stat	us Cable impr	operly connected	1	
Connection Status		MAC Addre	ess 00:90:4C:0	DF:F1:1F		
		IP Addre	ess 0.0.0.0			
		Subnet Ma	sk 0.0.0.0			
		Gatew	ay 0.0.0.0			
		Primary DNS Serv	ver 0.0.0.0			
		Secondary DNS Serv	ver 0.0.0.0			
		Up Tir	me 0Day(s)00:	00:00		

3. If **Connecting** is displayed and no WAN IP address is seen, try refreshing the page five times. And if it still displays **Connecting** try steps below:

- 1). Contact your ISP for assistance.
- 2). Read the connection diagnostic info on WAN status.

∆_{Note}

The following diagnostic info will be displayed on particular occasions for your reference:

1). You have connected to Internet successfully.

2). You might have entered a wrong user name and/or a wrong password. Please contact your ISP for the correct user name and password and enter them again.

3). Ethernet cable is not connected or not properly connected to the WAN port on the device. Please reconnect it properly.

4). No response is received from your ISP. Please verify that you can access Internet when you directly connect your PC to an Internet-enabled modem. If not, contact your local ISP for help.

5 Connect to Device Wirelessly

Having finished above settings, you can search the device's wireless network (SSID) from your wireless devices (notebook, iPad, iPhone, etc) and enter a security key to connect to it wirelessly. Desktop computers should be equipped with wireless network cards.

WIN7 OS

1. Click on the icon data the bottom of the right corner on your desktop;

2. Select the network you wish to connect, such as Tenda-000090;

3. When the following dialog box appears, it indicates connecting to the network;

Connect to a Network	
Getting information from Tenda_000	0090
	Cancel
4. Enter your security key and click OK ;	
Connect to a Network	
Type the network security key	

Security key:	
	📝 Hide characters

5. When displaying Connected, you have connected to network successfully.

Windows XP OS

1. Click on My Network Places and select Properties;

2. Click Local Area Connection and select View Available Wireless Networks;

Anna	Disable
Incomin	View Available Wireless Networks
-	Status
	Repair
Incomi	Bridge Connections
Connect	Create Shortcut
	Lielere
LAN or F	Rename
1	Properties
Luba	445
Local Area	a Local

3. Select the SSID you wish to connect, such as Tenda_home, click **Connect**, enter the security key and then click **OK**;

4. You can access Internet via the device when **Connected** appears next to the wireless network name you selected.

Chapter 3 Configurations

This chapter describes the Web based configurations for easier management of your router. During the configuration operation, if you are not clear about a certain feature, simply read the related helpful info below.

1 Status

1.1 System Status

Here you can see at a glance of the operating status of the device.

DHCP Clients			53	ve Cance	1	
Static Assignment			04	ve ourie		
DHCP – Guest Network						
Client List - Guest Network	¢.					

- IP Address: The router's LAN IP. The default is 192.168.0.1 and you can change it according to your needs.
- Subnet Mask: Router's LAN subnet mask. The default is 255.255.255.0.

∆_{Note}

If you change the LAN IP address, you must use the new one to log on to the web utility.

2.2 WAN

There are three types of Internet connection: Dynamic IP (DHCP), Static IP, and PPPoE(including dual access).

Dynamic IP

Select Dynamic IP (DHCP) to obtain IP Address information automatically from your ISP. Select this option if your ISP does not provide you with any IP information.

Tenda							Versian Praduce (
	Home	Status	Netwo	rk	Wireless	Advanced	US8

- Connection Type: Displays a list of available Internet connection types.
- MTU: Maximum Transmission Unit. The default value is1450.

Tenda

Static IP

Select Static IP Address if your ISP provides all the connection information. You will need to enter the provided IP address, subnet mask, gateway address, and DNS address(es) in the corresponding fields.

Tenda					Version Produc	VI (2002en (7192) Name - Fisches Windess Rower		
H	ome Status	Network	Wireless	Advanced	USB	Security	Tools

MAC Clone	Re	store to Factory I	Detault MAC	Cione MAC		by your ISP.	
DHCP Server		Sav	e Cance	el		Normally you d change its defa	on't need to ult value.
DHCP Clients						However, some	ISPs may
Static Assignment						address (not re	outer's default
DHCP - Guest Network						WAN MAC) for connection aut	Internet nentication
Client List - Guest Network						and shall give y MAC. In this ca	you a valid se, simply

- MAC Address: Configure the router's WAN MAC address.
- Restore to Factory Default MAC: Reset the router's WAN MAC to factory default.
- Clone MAC: Clicking this button copies the MAC address of your PC to the MAC Address field in the router.

▲_{Note}

1. Normally you don't need to change the default WAN MAC value. However, some ISP's may require the client PC's MAC address for Internet connection authentication. In this case, simply enter the MAC address in the WAN MAC Address field or click the **Clone MAC** button. Note that the WAN MAC address in the **Status** interface will be updated accordingly once you have changed it.

2. Remember to reboot the router to activate the new WAN MAC. DO NOT use the **Clone MAC** feature unless required by your ISP.

3. Only the MAC addresses of the PCs on the LAN can be cloned to the router.

2.5 DHCP Server

The Dynamic Host Configuration Protocol (DHCP) is an automatic configuration protocol used on IP networks. If you enable the built-in DHCP server on this device, it will automatically configure the TCP/IP protocol settings for all PC's in the LAN, including IP address, subnet mask, gateway, and DNS.

Tend a						Version V1.0.0.0_en (7192) Product Name F Series Wireless Router

		Sa	ive Cance			address.	ang, chung		

- DHCP Server: Select whether to enable or disable the router's DHCP server feature.
- Start IP Address: Enter the starting IP address for the DHCP server's IP assignment.
- End IP Address: Enter the ending IP address for the DHCP server's IP assignment.
- Lease Time: The length of time for the IP address lease.

Tips -----Tips -----The device has enabled the DHCP server by default and it is not advisable to disable it unless necessary.
To apply the DHCP server settings to all PC's on your LAN, you must set all PC's to "Obtain an IP address

automatically" and "Obtain DNS server address automatically".

2.6 DHCP Clients

This list displays the DHCP dynamic client list, which includes host name, IP address, MAC address, and lease time information.

Tenda						Vers Prod	en VI000. ut Name Fästes (6)	en (7192) refess Rouver

- Host: Displays clients' host names.
- IP Address: Displays IP addresses that clients obtained from the DHCP server.
- MAC Address: Displays the MAC address of a given host.
- Lease Time: Remaining time for a corresponding IP address lease.

2.7 Static Assignment

If you would like some devices on your network to always have fixed IP addresses, you can use this feature and manually add a static DHCP assignment entry for each device.

For example: To have a PC at the MAC address of 00:15:58:c0:d4:3f always receive the same IP address of 192.168.0.150, simply enter the IP and MAC addresses in the corresponding fields and click **Add** and then the **Save** button to complete.

- IP Address: Enter the IP address for static DHCP assignment.
- MAC Address: Enter the MAC address of a computer to always receive the same IP address you specify.
- Add: Click it to add a new IP-MAC static assignment entry to list.
- Edit: Click it to change an existing entry.
- Delete: Click to remove an existing entry.

2.8 DHCP-Guest Network

If you enable the built-in DHCP server for the Guest Network on the router it will automatically configure the TCP/IP protocol settings for all PC's on the Guest Network, including IP address, subnet mask, gateway, and DNS.

3 Wireless

The **Wireless** tab includes 8 submenus: Basic, Guest Network, Security, Advanced, Wireless Access Control, Wireless Extender, WPS, and Connection Status. Clicking any of them enters the corresponding interface for configuration. Details are explained below:

Basic	
Guest Network	
Security	
Advanced	
Wireless Access Control	
Wireless Extender	
WPS	
Connection Status	

3.1 Basic

This section allows you to manage your wireless network. You can select your country, configure the wireless network name (SSID), network mode, and channel settings, etc.

Ha	ome Status I	Wetwork Wireless	Advanced	USB
Basic	Basic Settings			
Guest Network	Use this section to configu	ure wireless basic settings.		
Security	2.4GHz Wireless	😨 Enable		
Advanced	Country	USA.	•	
Wireless Access Control	SSID Broadcast	Enable O Disable		
Wireless Extender	Primary SSID	Tenda_07A01E		
WPS	Secondary SSID	Tenda_Guest_07A010		
Connection Status	802.11 Mode	11b/g/n mixed		
	Channel	2442MHz (Channel 7)	•	
	Channel Bandwidth	20 20/40		
	Extension Channel	2422MHz (Channel 3)	•	

- 2.4GHz Wireless Network: Check/uncheck to enable/disable the 2.4GHz wireless feature. If disabled, all 2.4GHz-based features will be disabled accordingly.
- Country: Select your country from the drop-down list. There are 12 options available.
- SSID Broadcast: Select Enable/Disable to make your wireless network visible/ invisible to any wireless

clients within coverage when they perform a scan to available networks. By default, it is enabled. When disabled, wireless clients will have to first know this SSID and manually enter it on their devices if they want to connect to the SSID.

- SSID : Service Set Identifier, is the unique name of a wireless network.
- 802.11 Mode: Select a correct mode according to your wireless clients. The default mode is 11b/g/n mixed.
- Channel: For optimal wireless performance, you may select the least used channel. It is advisable that you select an unused channel from the drop down list, or "Auto" to let the router detect and select the best possible channel for your wireless network to operate on.
- Channel Bandwidth: Select a proper channel bandwidth to enhance wireless performance. When there only 11n or a mix of 11b/g/n wireless clients, please select the 802.11n mode of 20/40M frequency band, but when there are only non-11n wireless clients, select the 20M frequency band mode
- Extension Channel : Available only in 11b/g/n mixed mode.

3.2 Guest Network

The Guest Network feature allows guests to access the Internet and other users on the guest network, while disallowing them to access the router's web manager, users on the master network, and clients connected to the LAN ports and secures your wireless master network.

Tenda	Home	Cratur	Nonwork	Mar	alass	Advanced	Versian Product

Wireless Access Control		Guest Network SS	ID Tenda_G	uest_07A	01F		
Wireless Extender							
WPS			S	ave	Cancel		
Connection Status							

- Guest Network: Select to enable/disable the guest network feature.
- SSID Broadcast: Check to enable/disable the SSID feature, making your wireless network visible/ invisible to any wireless clients within coverage when they perform a scan to available networks. By default, it is enabled, but when disabled, wireless clients will have to first know this SSID and manually enter it on their devices if they want to connect to the SSID.
- AP Isolation: If enabled, clients connecting to the guest network will be mutually inaccessible.
- Guest Network SSID : Service Set Identifier, is the configured unique name of the guest network.

<mark>≜∧</mark>Note

AP Isolation is disabled by default. If enabled, clients connecting to the guest network will be mutually inaccessible.

3.3 Security

This section allows you to encrypt your wireless network to block unauthorized accesses and malicious packet sniffing.

Tenda						Versi Frod
Н	ome	Status	Network	Wireless	Advanced	USB
Basic	5	ecurity Setting	s			
Guest Network	Fo	or security purpose,	we recommend	you to encrypt you	r wireless network us	ing WPA2-
Security	PS	SK AES.

Wireless Access Control		Security Mo	de			
Wireless Extender			None			
WPS			WEP			
Connection Status			WPA-PSK/	WPA2-PSK		
			Sa	ive Cance	1	

Three security modes are available: None, WEP, and WPA-PSK/WPA2-PSK.

WEP

WEP is intended to provide data confidentiality comparable to that of a traditional wired network. Two methods of authentication can be used with WEP: Open System authentication and Shared Key authentication.

Security Mo	de					
(None					
	WEP					
Authentication Type	Open 💌					
WEP Key Format	ASCII					
Key Select	Key Content	Key Length				
Key 1 🔘		64-bit				
Key 2 🔘		None 💌				
Key 3 🔘		None 💌				
Key 4 🔘		None 💌				
	🔲 Display Key					
	64-bit Key: 5 ASCII or 10 hex characters; 128-bit Key: 13 ASCII or 26 hex characters.					
(WPA-PSK/WPA2-PSK					
	Save Cancel					

- Authentication Type: Select Open or Shared from the drop-down list.
- WEP Key Format: Select Hex or ASCII from the drop-down list.
- Key Select: Select a key from the preset keys 1-4 for current use.

WPA-PSK

The WPA protocol implements the majority of the IEEE 802.11i standard. It enhances data encryption through the Temporal Key Integrity Protocol (TKIP) which is a 128-bit per-packet key, meaning that it dynamically generates a new key for each packet. WPA also includes a message integrity check feature to prevent data packets from being tampered with. Only authorized network users can access the wireless network. WPA adopts enhanced encryption algorithm over WEP.

~	
Authentication Type	WPA-PSK
Cipher Type	AES
Security Key	•••••• Display Key
	(8-63 ASCII or 64 hex characters)
Key Renewal Interval	3600
	Down to 60 seconds. 0 indicates no renewal.
	Save Cancel

- Cipher Type: Select AES (advanced encryption standard) or TKIP (temporary key integrity protocol) &AES.
- Security Key: Enter a security key, which must be between 8-63 ASCII characters long.
- Key Renewal Interval: Enter a valid time period for the key to be changed.

WPA2-PSK

WPA2 is based on 802.11i and uses Advanced Encryption Standard (AES) instead of TKIP. It is more secured than WPA and WEP.

Authentication Type	WPA2-PSK
Cipher Type	AES
Security Key	•••••• Display Key
	(8-63 ASCII or 64 hex characters)
Key Renewal Interval	3600
	Down to 60 seconds. 0 indicates no renewal.
	Save Cancel

- Cipher Type: Select AES (advanced encryption standard) or TKIP (temporary key integrity protocol) &AES.
- Security Key: Enter a security key, which must be between 8-63 ASCII characters long.
- Key Renewal Interval: Enter a valid time period for the key to be changed.

3.4 Advanced

This section allows you to configure advanced settings, including AP Isolation, Beacon interval, Fragment threshold, RTS threshold, and DTIM interval, etc.

Tenda						Version Produc		
	Home	Status	Network	Wireless	Advanced	USB		
Basic		dvanced-Wirel	ess			-		
Guest Network		AP Isolat	ion 🔲					
Security		Beacon Inter	val 100	ms (Range	e: 20 - 999; Default:	100)		
Advanced		Fragment Thresh	old 2346	(Range; 2	56 - 2346; Default: 2	2346)		
Wireless Access Control		RTS Thresh	old 2347	(Range: 1	- 2347; Default: 234	47)		
Wireless Extender		DTIM Inter	val 1	(Range: 1	- 255; Default: 1)			
WPS		Transmitting Pov	ver 🔘 High 👔	Dow				
Connection Status		Short	GI 🔘 Enable	🗊 Enable 💿 Disable				
		WMM Capa	ble 🔘 Enable	💮 Disable				
		APSD Capa	ble 💮 Enable	💿 Disable				
			Sa	ve Cance	21			

- AP Isolation: Isolates clients connecting to the master SSID.
- Beacon Interval: A time interval between any two consecutive Beacon packets sent by an Access Point to synchronize a wireless network. DO NOT change the default value of 100 unless necessary.
- Fragment Threshold: Specify a Fragment Threshold value. Any wireless packet exceeding the preset value will be divided into several fragments before transmission. DO NOT change the default value of 2346 unless necessary.
- RTS Threshold: If a packet exceeds such set value, RTS/CTS scheme will be used to reduce collisions. Set it to a smaller value provided that there are distant clients and interference. For normal SOHO, it is recommended to keep the default value unchanged, otherwise, the router performance may be degraded.
- DTIM Interval: A DTIM (Delivery Traffic Indication Message) Interval is a countdown informing clients of the next window for listening to broadcast and multicast messages. When such packets arrive in the router's buffer, the router will send DTIM (delivery traffic indication message) and DTIM interval to alert clients of the receiving packets.
- WMM-Capable: WMM is QoS for your wireless network. Enabling this option may better stream wireless multimedia data (such as video or audio).
- ASPD Capable : Select to enable/disable the auto power saving mode.

3.5 Wireless Access Control

The MAC-based Wireless Access Control feature can be used to allow or disallow clients to connect to your wireless network.

Tenda	7					Versia Produ

WDS

WDS (Wireless Distribution System), this feature can be used to extend your existing 2.4Ghz network coverage. The details below outline how to configure this feature in the 2.4GHz band.

For example:

As seen in the figure above, PC1 and PC2 access Internet via a wireless connection to Router 1. While PC3 and PC4 are too far to directly connect to Router 1 for Internet access. Now you can use the WDS bridge feature to let PC3 and PC4 access Internet.

Before you get started:

1. View and note down the wireless security settings: security mode, cipher type, security key, etc. on Router 1; Click **Status**>LAN Status and check the IP address.

Tenda						Vers Prod

1. When the settings finished, remember to enter **Connection Setup** to set up Internet connection.

2. Verify that the SSID, channel, and security mode on the page match those of the added wireless network. If not, manually correct them.

3. For the normal wireless connection between two routers, do not change this router's SSID settings, including SSID, channel, security mode and security key.

Universal Repeater

In this mode, the router will relay data to an associated root AP and AP function is enabled meanwhile. The wireless repeater relays signal between its stations and the root AP for greater wireless range. Steps are shown as below:

1. Click Wireless>Wireless Extender, select Universal Repeater in the extender mode and click Open Scan.

Tenda						Versi Produ

4. Click Close Scan and OK.

5. Save the settings and the router will restart automatically.

3.7 WPS

Wi-Fi Protected Setup makes it easy for home users who know little of wireless security to establish a secure wireless home network, as well as to add new devices to an existing network without entering long passphrases or configuring complicated settings. Simply enter a PIN code or press the software PBC button or hardware WPS button (if equipped) and a secure wireless connection can be established.

Wireless Extender			Reset 00	B Start P		
Connection Status			Say	e Cance	el	

- Enable WPS: Select to enable/disable the WPS encryption.
- WPS Mode: Select PBC (Push-Button Configuration) or PIN.
- Reset OOB: When selected, the WPS LED turns off and the WPS function will be disabled automatically. The WPS server on the router enters idle mode and will not respond to any client's WPS connection request.

Operation Instructions:

PBC: The WPS LED will blink for 2 minutes after you press the hardware WPS button on the router for 1 second, and means that the PBC encryption method is successfully enabled. An authentication routine will be performed between your router and the WPS/PBC enabled wireless client device during this time, if it succeeds, the wireless client device will connect to your router and the WPS LED will turn off. Repeat the steps above if you want to add more wireless client devices to the router.

PIN: To use this option, you must know the PIN code from the wireless client and enter it in the corresponding field on your router while using the same PIN code on the client side for this connection.

∆_{Note}

To use the WPS encryption, the wireless adapter must be WPS-capable.

3.8 Connection Status

This section displays wireless clients information (if any).

4 Advanced Applications

The **Advanced** tab includes the following 8 submenus: Bandwidth Control, DDNS, Virtual Server, DMZ Host, UPnP, IPTV, Routing Table, and Static Routing. Clicking any of them enters the corresponding interface for configuration. Details are explained below:

Bandwidth Control	
DDNS	
Virtual Server	
DMZ Host	
UPnP	
IPTV	
Routing Table	
Static Routing	

4.1 Bandwidth Control

To better manage bandwidth allocation and optimize network performance, use the Bandwidth Control feature.

- Enable: Check/uncheck to enable/disable current entry. When disabled, corresponding entry will not take effect.
- IP Range: Enter a single IP or an IP range.
- Uplink Bandwidth: Max uplink traffic.
- Downlink Bandwidth : Max downlink traffic.
- Description: Briefly describe the current entry.

4.2 DDNS

Dynamic DNS or DDNS is a term used for the updating in real time of Internet Domain Name System (DNS) name servers. We use a numeric IP address allocated by Internet Service Provider (ISP) to connect to Internet. The address may either be stable ("static"), or may change from one session on the Internet to the next ("dynamic"). However, a numeric address is inconvenient to remember and an address which changes unpredictably makes connection impossible. The DDNS provider allocates a static host name to the user. Whenever the user is allocated a new IP address it is communicated to the DDNS provider by software

running on a computer or network device at that address. The provider distributes the association between the host name and the address to the Internet's DNS servers so that they may resolve DNS queries. The result is uninterrupted access to devices and services whose numeric IP address may change is maintained.

Tenda	3					Versi Produ
	Home	Status	Network	Wireless	Advanced	US8

			Sa	ve Cance	d.	

- Service Provider: Select your DDNS service provider from the drop-down menu.
- User Name: Enter the DDNS user name registered with your DDNS service provider.
- Password: Enter the DDNS Password registered with your DDNS service provider.
- Domain Name: Enter the DDNS domain name with your DDNS service provider.
- Connection Status: Displays current status of connection with the DDNS server.

Click **Save** to save your settings.

4.3 Virtual Server

The Virtual Server feature grants Internet users access to services on your LAN. It is useful for hosting online services such as FTP, Web, or game servers. For each Virtual Server, you define a WAN port on your router for redirection to an internal LAN IP Address.

Tenda	8						Vers Prod
ſ	Home	Status	letwork Wir	eless Advan	ced	U	SB
Bandwidth Control	Vir	tual Server					
DDNS	Virtu	al Server is useful for	r web servers, ftp serv	vers, e-mail servers, g	gaming and	other	r .
Virtual Server	spec	cial Internet application router's WAN port w	ons. When enabled, co ill be forwarded to the	mmunication request: specified LAN IP add	s from Inter d <mark>r</mark> ess. Be su	net to	i.
DMZ Host	stati	cally assign the host's	s IP for this function to	be consistent.

IPTV	1	+		Bo	th 💌	E	
Routing Table	2	-		Bot	th 💌		
Static Routing	3	-		Bot	th 💌		
	4	IT H		Bo	th 💌		
	5	-		Bot	th 💌		
	6	H		Bot	th 💌		
						1.5	
	7	-		Bot	th 💌		10

- Ext Port Int Port: External Port Internal Port, enter the WAN/LAN service ports.
- Internal IP: The IP address of a computer used as a server in LAN.
- Protocol: Includes TCP, UDP, and Both. Select "Both" if you are not sure about which protocol to use
- Enable: The corresponding entry takes effect only if you checked this option.
- Delete: Remove a corresponding entry
- Well-known Service Port: The well-known Service Port lists widely used protocol ports. Simply select a port, an entry ID, and click the "Add to" button to transfer the selected port to the corresponding fields of the selected entry. In case you cannot find the port you will need to enter it manually.

Example: You want to share some large files with your friends who are not in your LAN, however, it is not convenient to transfer such large files across the network. You can set up your own PC as a FTP server and use the Virtual Server feature to let your friends access these files. Assuming that the static IP address of the FTP server (Namely, your PC) is 192.168.0.110, you will want your friends to access this FTP server on the default port of 21 using the TCP protocol, details are explained below:

1. Enter 21 in both Ext Port and Int Port fields or select FTP from **Well-known Service Port** and an entry ID 21 will be automatically transferred to the corresponding fields of the selected entry.

2. Enter 192.168.0.110 for the IP Address, select TCP and then select **Enable**.

eci ur atic	ial Internet applications. router's WAN port will b cally assign the host's IP	When enabled, communicate forwarded to the specifie for this function to be considered to the specifie for this function to be considered to the specifie for this function to be considered to the specifie for this function to be considered to the specifie for this function to be considered to the specifie for t	ation requests from Inte ed LAN IP address. Be s istent.	rnet to
)	Ext Port-Int Port	Internal IP	Protocol	E. D.
	21 - 21	192.168.0.110	Both	
	_		Both	

3. Click **Save** to save your settings.

Now, your friends only need to enter ftp://xxx.xxx.xxx.21 in their browsers to access your FTP server. xxx.xxx.xxx. Assuming the router's WAN IP address is 172.16.102.89, then your friends need to enter "ftp://172.16.102.89: 21" in their browsers.

∧_{Note}

If you include port 80 in this section, you must set the port for remote (web-based) management to a different number other than 80, such as 8080, otherwise the virtual server feature may not take effect.

4.4 DMZ Host

In some cases, a computer may need to be completely exposed to the Internet for implementation of a 2-way communication. To do so, we will set it as a DMZ host.
