7 Radiation Emission Test

| | |
|-----------------------|---|
| Test Requirement: | FCC Part 15.109 |
| Test Method: | Based on ANSI 63.4:2009 |
| Test Date: | April 22, 2009 |
| Frequency Range: | 30MHz to 1GHz |
| Measurement Distance: | 3m |
| Detector: | Peak for pre-scan (120kHz resolution bandwidth) Quasi-Peak if maximised peak within 6dB of limit |

Definition: ANSI STANDARD C63.4-2003 12.1.1.1 SUPERREGENERATIVE RECEIVER:
A Signal Generator was set to the unit under test operating frequency.
An un-Modulated continuous wave (CW) signal was radiated at the super regenerative receiver operating frequency to cohere the characteristic broadband emissions from the receiver.

7.1 Test Equipment

Please refer to Section 5 this report.

7.2 Measurement Uncertainty

The EUT is placed on a turntable, which is 0.8 meter above ground. The turntable can rotate 360 degrees to determine the position of the maximum emission level. EUT is set 3 meters away from the receiving antenna, which is mounted on an antenna tower. The antenna can move up and down between 1 to 4 meters to find out the maximum emission level. Broadband antenna is used as a receiving antenna. Both horizontal and vertical polarization of the antenna is set on test. Based on ANSI C63.4:2009, The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of a radiation emissions measurement at Waltek EMC Lab is ± 2.9 dB.

7.3 Test Procedure

1. New battery were installed in the equipment under test for radiated emissions test.
2. Maximizing procedure was performed on the six (6) highest emissions to ensure EUT is compliant with all installation combinations.
3. All data was recorded in the peak and average detection mode.
4. The EUT was under normal mode during the final qualification test and the configuration was used to represent the worst case results.
5. The device was rotated through three orthogonal axes to determine which attitude and configuration produce the highest emission during measurement.

7.4 Spectrum Analyzer Setup

According to FCC Part 15.109, the system was tested to 1000 MHz.

Start Frequency30MHz
 Stop Frequency 1000 MHz
 Sweep Speed Auto
 IF Bandwidth..... 100 kHz
 Video Bandwidth 100KHz
 Quasi-Peak Adapter Bandwidth 120 kHz
 Quasi-Peak Adapter Mode.....Normal
 Resolution Bandwidth 100KHz

7.5 Corrected Amplitude & Margin Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain from the Amplitude reading. The basic equation is as follows:

$$\text{Corr. Ampl.} = \text{Indicated Reading} + \text{Antenna Factor} + \text{Cable Factor} - \text{Amplifier Gain}$$

7.6 Test Arrangement

The arrangement of the equipment is installed to meet the standards and operating in a manner, which tends to maximize its emission characteristics in a normal application. The detailed information refers to test picture.

7.7 Radiated Emissions Limit

| Frequency(MHZ) | Distance(m) | Field strength(dBuV/m) |
|----------------|-------------|------------------------|
| 30-88 | 3 | 40.0 |
| 88-216 | 3 | 43.5 |
| 216-960 | 3 | 46.0 |
| Above 960 | 3 | 54.0 |
