### 3.1 Korea Testing Laboratory test location

All tests were conducted at Korea Testing Laboratory. The site address is 516 Haean-ro, Sa-dong, Sangnok -gu, Ansan-si, Gyeonggi-do, 426-901, KOREA. The radiated emission test site is a 10-meter semi-anechoic chamber. The chamber meets the characteristics of CISPR 16-1:1993 and ANSI C63.4: 1992. For measure -ments, a remotely controlled flush-mount metal-top turntable is used to rotate the EUT a full 360 degrees. A remote controlled non-conductive antenna mast is used to scan the antenna height from one to four meters.

The FCC registration number is 408324. The Industry Canada filing number for this site is 6298.

# IV. TEST RESULTS

### 4.1 Transmission Requirements (FCC Part 15.231(a) & RSS-210 A1.1.1)

#### 4.1.1 Limit of Transmission Time

- According to 15.231(a)(1), a manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being release.
- ☐ According to 15.231(a)(2), a transmitter activated automatically shall cease transmission within 5 seconds after activation.

#### 4.1.2 Test Results

After <u>85 ms</u>, the transmitter was automatically deactivated.

- Deactivation time -

# 4.2 Field Strength Measurements (FCC Part 15.231(b) & RSS-210 A1.1.2)

#### 4.2.1 Test procedure

- Measurements were made over the frequency range of 30 MHz to ten times the highest frequency operating within the device.
- The measuring receiver meets the requirements of Section One of CISPR 16 and the measuring antenna correlates to a balanced dipole.
- From 30 to 1000 MHz, a quasi-peak detector was used for measurement. Above 1000 MHz, average Measurements were performed.
- The antenna is adjusted between 1m and 4m in height above the ground plane for maximum fieldstrength readings.
- The antenna-to-EUT azimuth is varied during the measurement to find the maximum field-strength readings.
- The antenna-to-EUT polarization (horizontal and vertical) is varied during the measurements to find the maximum field-strength readings.
- The EUT was placed on a wooden table 80 cm above the ground reference plane.
- Equipment setup for radiated disturbance tests followed the guidelines of ANSI C63.4.
- Peak readings were taken in three orthogonal planes.
- The bandwidths of the fundamental emissions were measured 20 dB down from the modulated carrier using the ANSI C63.4 specified bandwidths. The bandwidth measurement was performed using a peak detector and the peak-hold function of the analyzer.
- The readings obtained from the measurement receiver were corrected for antenna factor, cable loss, and pre-amp gain.

#### 4.2.2 Field strength calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. All factors are included in the reported data.

FS = R + AF + CORR - FO

Where: FS = Field Strength

R = Measured Spectrum analyzer Input Amplitude

AF = Antenna Factor

CORR = Correction Factor = CL + AG

CL = Cable Loss

AG = Amplifier Gain

FO = Distance Falloff Factor

### 4.2.4 Calculation of Duty Cycle Correction Factor

The period of the pulse train is determined by observing it on a spectrum analyzer with zero frequency span. A plot is then made of the pulse train with a sweep time of 100 milliseconds. This sweep determines the duration of the pulse train, which in this case is millisecond.

Total ON Time during 100 ms =  $1.1 \text{ ms } \times 9 + 0.75 \text{ ms } \times 42 = 41.4 \text{ ms}$ Duty cycle correction factor =  $20 \log (41.4 \text{ ms}/100 \text{ms}) = -7.65$ 

Duty Cycle correction factor = -7.65 dB

#### 4.2.4. Test Results

The MR762 met the field strength and bandwidth requirements of FCC § 15.231 for fundamental and spurious emissions. See Table 4-1 for the measured fundamental and spurious emissions. The peak value of the fundamental and spurious emissions did not exceed the limits of FCC § 15.231 (5)(b). Additionally, there were no radiated emissions from the device in the restricted bands of § 15.205 which exceeded the limit of § 15.209. All other spurious emissions not shown below were greater than 20 dB bandwidth of the fundamental emission was less than 0.25% of the carrier frequency.

The field strength of emissions appearing within above frequency bands did not exceed the limits shown in section 15.209. At frequency equal to or less than 1000MHz, compliance with the limits section 15.209 was demonstrated using measurement employing a CISPR quasi-peak detector. Above 1000MHz, demonstrated based on the average value of the measured emissions.

- (2) If the intentional radiator was operated under the radiated emission limits of the general requirements of section 15.209, it's fundamental emissions were not located in the frequency bands 54-72MHz, 76-88MHz, 174-216MHz, 470-860MHz.
- (3) The level of any unwanted emissions from an intentional radiator did not exceed the level of the fundamental emission.
- (4) Radiated and spurious emissions were checked from 30MHz to 3GHz. And all other emissions not reported on data were more than 20 dB below the permitted level.

### 4.3 Bandwidth of Momentary Signals (FCC Part 15.231(c) & A1.1.3)

#### 4.3.1 Limit

The bandwidth of emission shall be no wider than 0.25% of the centre frequency for devices operating between 70~900 MHz. For devices operating above 900 MHz, the emission shall be no wider than 0.5% of the centre frequency.

- 1. Carrier Frequency = 433.92 MHz
- 2. The bandwidth of emission shall be no wider than 0.25 % of center frequency.
- 3. Limit: less than 1.0848 MHz (433.92 x 0.0025)
