

AVERAGE POWER - MULTIBAND

XMR 2022.02.07.0

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data.

TEST EQUIPMENT

Description	Manufacturer	Model	ID	Last Cal.	Cal. Due
Block - DC	Fairview Microwave	SD3239	ANC	2022-03-02	2023-03-02
Attenuator	Fairview Microwave	SA3N10W-20	RKY	2022-11-15	2023-11-15
Analyzer - Spectrum Analyzer	Keysight	N9010A	AFO	2022-09-08	2023-09-08
Generator - Signal	Agilent	N5173B	TIW	2020-07-17	2023-07-17

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The fundamental emission output power (maximum average conducted output power) was measured using the channels and modes as called out on the following data sheets. The transmit power was set to its default maximum.

The method in section 5.2.4.4 of ANSI C63.26 was used to make the measurements. This method uses trace averaging across the ON and OFF times of the EUT transmissions in the spectrum analyzer channel power function using an RMS detector. Following the measurement a duty cycle correction was applied by adding $[10 \log (1/D)]$, where D is the duty cycle in decimal, to the measured power to compute the average power during the actual transmission times.

Dual band with 3.45GHz carriers at maximum (200W) and 3.7GHz carriers at 280W test cases.

The port power (7.5W) and radio power (480W) are at maximum rated levels. Testing was performed on TAB 57; the highest power port (worst case port) for the 3.45GHz Band. 256QAM modulation was used for all testing.

- (a) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at bot channel and the 3.7G Band NR40 carrier (4.375W/TRX) at top ch operating simultaneously. Maximum spacing between carriers.
- (b) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at top channel and the 3.7G Band NR40 carrier (4.375W/TRX) at bot ch operating simultaneously. Minimum spacing between carriers.
- (c) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at bot channel and the 3.7G Band NR100 carrier (4.375W/TRX) at top ch operating simultaneously. Maximum spacing between carriers.
- (d) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at top ch and the 3.7G Band NR100 carrier (4.375W/TRX) at bottom ch operating simultaneously. Minimum spacing between carriers.

Dual band with 3.7G carriers at maximum (320W) and 3.45G carriers at 160W test cases.

The port power (7.5W) and radio power (480W) are at maximum rated levels. Testing was performed on TAB 22; the highest power port (worst case port) for the 3.7GHz Band. 256QAM modulation was used for all testing.

- (a) 3.7G Band NR100 carrier at max power (5.00W/TRX) & max OBW at bot channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) at min OBW at top ch operating simultaneously. Min spacing
- (b) 3.7G Band NR100 carrier at max power (5.00W/TRX) & max OBW at top channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) and min OBW at bot ch operating simultaneously. Max spacing
- (c) 3.7G Band NR40 carrier at max power (5.00W/TRX) & max PSD (8W/MHz) at bot channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) and min OBW at top ch operating simultaneously. Min spacing
- (d) 3.7G Band NR40 carrier at max power (5.00W/TRX) & max PSD (8W/MHz) at top channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) and min OBW at bot ch operating simultaneously. Max spacing

AVERAGE POWER - MULTIBAND

EUT: AQQA				Work Order: NOKI0052					
Serial Number: YK224300010				Date: 24-Jan-23					
Customer: Nokia of America Corporation				Temperature: 23 °C					
Attendees: John Rattanaavong, Michell Hill				Humidity: 28% RH					
Project: None				Barometric Pres.: 1018 mbar					
Tested by: Brandon Hobbs			Power: 54 VDC	Job Site: TX07					
TEST SPECIFICATIONS				Test Method					
FCC 27:2023				ANSI C63.26:2015					
COMMENTS									
All losses in the measurement path were accounted for: attenuators, cables, DC block and filter when in use. Band n77 carriers were enabled at maximum power levels for the 3.45GHz band at 3.125watts/carrier and for the 3.7GHz band at 5watts/carrier in uniquely separate dual mode operating configurations. The following is the output power measurements at the worst case by band radio output ports. The output power was measured for a single carrier over the carrier channel bandwidth on the worst case port. The total output power for multiport (64x64 MIMO) operation was determined based upon ANSI 63.26 clauses 6.4.3.1 and 6.4.3.2.4 (10 log Nout). The total output power for a Sixty-Four port operation is single port power +18.1 dB [i.e. 10log(64)].

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data.

TEST EQUIPMENT

Description	Manufacturer	Model	ID	Last Cal.	Cal. Due
Block - DC	Fairview Microwave	SD3239	ANC	2022-03-02	2023-03-02
Analyzer - Spectrum Analyzer	Keysight	N9010A	AFO	2022-09-08	2023-09-08
Generator - Signal	Agilent	N5173B	TIW	2020-07-17	2023-07-17

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The fundamental emission output power (maximum average conducted output power) was measured using the channels and modes as called out on the following data sheets. The transmit power was set to its default maximum.

The method in section 5.2.4.4 of ANSI C63.26 was used to make the measurements. This method uses trace averaging across the ON and OFF times of the EUT transmissions in the spectrum analyzer channel power function using an RMS detector. Following the measurement a duty cycle correction was applied by adding $[10 \log (1/D)]$, where D is the duty cycle in decimal, to the measured power to compute the average power during the actual transmission times

RF conducted emissions testing was performed on the worst case (highest average power) port by band. The AQQQA antenna ports are all within the manufacturer's rated output power tolerances (the RF power variation between antenna ports is small as shown in this certification testing) and the antenna port 57 for the 3.45GHz band was selected to perform the testing for this effort.

The total average transmit power of all antenna ports was determined per ANSI C63.26-2105 paragraph 6.4.3.1

FCC 27:2023		ANSI C63.26:2015	
COMMENTS			
All losses in the measurement path were accounted for: attenuators, cables, DC block and filter when in use. Band n77 carriers were enabled at maximum power levels for the 3.45GHz band (at 3.125 watts/carrier for NR40 and at 2.5 watts/carrier for NR20 & NR30). The following is the output power measurement at the worst case radio output port. The output power was measured for a single carrier over the carrier channel bandwidth on the worst case port. The total output power for multiport (64x64 MIMO) operation was determined based upon ANSI 63.26 clauses 6.4.3.1 and 6.4.3.2.4 (10 log Nout). The total output power for a Sixty-Four port operation is single port power +18.1 dB [i.e. 10log(64)].

Attenuator	Fairview Microwave	SA3N10W-20	RKY	2022-11-15	2023-11-15
Signal Analyzer	Keysight	N9030B	R332	2022-07-28	2023-07-28
Generator - Signal	Agilent	N5173B	TIW	2020-07-17	2023-07-17

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer.

Because the conducted Output Power was measured using a RMS Average detector, the Peak to Average Power Ratio (PAPR) was measured to show that the maximum peak-max-hold spectrum to the maximum of the average spectrum does not exceed the rule part defined limit.

The PAPR measurement method is described in ANSI C63.26 section 5.2.3.4.

The PAPR was measured using the CCDF function of the spectrum analyzer.

Per FCC part 27.50(j)(4) the PAPR limit shall not exceed 13 dB for more than the ANSI described 0.1% of the time.

RF conducted emissions testing was performed on the worst case port by band. The AQQQA antenna ports are all within the manufacturer's rated output power tolerances (the RF power variation between antenna ports is small as shown in this certification testing) and the antenna port 22 for the 3.7GHz band and port 57 for the 3.45GHz band were selected to perform the testing for this effort.

Dual band with 3.45GHz carriers at maximum (200W) and 3.7GHz carriers at 280W test cases.

The port power (7.5W) and radio power (480W) are at maximum rated levels. Testing was performed on TAB 57; the highest power port (worst case port) for the 3.45GHz Band. 256QAM modulation was used for all testing.

- (a) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at bot channel and the 3.7G Band NR40 carrier (4.375W/TRX) at top ch operating simultaneously. Maximum spacing between carriers.
- (b) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at top channel and the 3.7G Band NR40 carrier (4.375W/TRX) at bot ch operating simultaneously. Minimum spacing between carriers.
- (c) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at bot channel and the 3.7G Band NR100 carrier (4.375W/TRX) at top ch operating simultaneously. Maximum spacing between carriers.
- (d) 3.45G Band NR40 carrier at maximum power (3.125W/TRX) at top ch and the 3.7G Band NR100 carrier (4.375W/TRX) at bottom ch operating simultaneously. Minimum spacing between carriers.

Dual band with 3.7G carriers at maximum (320W) and 3.45G carriers at 160W test cases.

The port power (7.5W) and radio power (480W) are at maximum rated levels. Testing was performed on TAB 22; the highest power port (worst case port) for the 3.7GHz Band. 256QAM modulation was used for all testing.

- (a) 3.7G Band NR100 carrier at max power (5.00W/TRX) & max OBW at bot channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) at min OBW at top ch operating simultaneously. Min spacing
- (b) 3.7G Band NR100 carrier at max power (5.00W/TRX) & max OBW at top channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) and min OBW at bot ch operating simultaneously. Max spacing
- (c) 3.7G Band NR40 carrier at max power (5.00W/TRX) & max PSD (8W/MHz) at bot channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) and min OBW at top ch operating simultaneously. Min spacing
- (d) 3.7G Band NR40 carrier at max power (5.00W/TRX) & max PSD (8W/MHz) at top channel and the 3.45G Band NR20 carrier (2.50W/TRX) at max PSD (8W/MHz) and min OBW at bot ch operating simultaneously. Max spacing
