Kimberly Zavala Quality Assurance Manager

This report and the information contained herein represent the results of testing test articles identified and selected by the client performed to specifications and/or procedures selected by the client. National Technical Systems (NTS) makes no representations, expressed or implied, that such testing is adequate (or inadequate) to demonstrate efficiency, performance, reliability, or any other characteristic of the articles being tested, or similar products. This report should not be relied upon as an endorsement or certification by NTS of the equipment tested, nor does it represent any statement whatsoever as to its merchantability or fitness of the test article, or similar products, for a particular purpose. This report shall not be reproduced except in full.

| FND OF REPORT   | 205 |

#### SCOPE

Tests have been performed on Nokia Solutions and Networks product Flexi Multiradio BTS RFM Model FXCA, pursuant to the relevant requirements of the following standard(s) in order to obtain device certification against the regulatory requirements of the Federal Communications Commission and Industry Canada.

- Code of Federal Regulations (CFR) Title 47 Part 2
- CFR Title 47 Part 22 Subpart H
- CFR Title 47 Part 90 Subpart S
- RSS-Gen Issue 4 November 2014
- RSS-132 Issue 3 January 2013

Conducted and radiated emissions data has been collected, reduced, and analyzed within this report in accordance with measurement guidelines set forth in the following reference standards:

ANSI C63.4-2009 ANSI TIA-603-C FCC KDB 971168 D01 v02r02

The intentional radiator above has been tested in a simulated typical installation to demonstrate compliance with the relevant FCC requirements.

Every practical effort was made to perform an impartial test using appropriate test equipment of known calibration. All pertinent factors have been applied to reach the determination of compliance.

The test results recorded herein are based on a single type test of Nokia Solutions and Networks product Flexi Multiradio BTS RFM Model FXCA and therefore apply only to the tested sample. The sample was selected and prepared by Hobert Smith of Nokia Solutions and Networks.

# **OBJECTIVE**

The primary objective of the manufacturer is compliance with the regulations outlined in the previous section. This Testing was performed in order to obtain a Class II permissive change to add LTE modulation Types.

Prior to marketing in the USA, the device requires certification. Prior to marketing in Canada, Class I transmitters, receivers and transceivers require certification.

Certification is a procedure where the manufacturer submits test data and technical information to a certification body and receives a certificate or grant of equipment authorization upon successful completion of the certification body's review of the submitted documents. Once the equipment authorization has been obtained, the label indicating compliance must be attached to all identical units, which are subsequently manufactured.

Maintenance of compliance is the responsibility of the manufacturer. Any modification of the product which may result in increased emissions should be checked to ensure compliance has been maintained (i.e., printed circuit board layout changes, different line filter, different power supply, harnessing or I/O cable changes, etc.).

Testing was performed only on Model FXCA. No additional models were described or supplied for testing.

# STATEMENT OF COMPLIANCE

The tested sample of Nokia Solutions and Networks product Flexi Multiradio BTS RFM Model FXCA complied with the requirements of the standards and frequency bands declared in the scope of this test report.

Maintenance of compliance is the responsibility of the manufacturer. Any modifications to the product should be assessed to determine their potential impact on the compliance status of the device with respect to the standards detailed in this test report.

# **DEVIATIONS FROM THE STANDARDS**

No deviations were made from the published requirements listed in the scope of this report.

# **TEST RESULTS**

#### Notes

Note 1 – Based on 100kHz RBW. In 1MHz bands immediately outside and adjacent to the frequency block an RBW of at least 1% of the emission bandwidth has been used.

Note 2 – Not Required per TCB guidance. Testing performed in original FXCA certification.

Note 3 – Applicant's declaration on a separate exhibit based on hypothetical antenna gains.

Note: FCC based on 26dB emissions bandwidth, IC based on 99% emissions bandwidth

# **EXTREME CONDITIONS**

Frequency stability is determined over extremes of temperature and voltage. The extremes of voltage were 85 to 115 percent of the nominal value.

Extreme Temperature was not tested per TCB Guidance. Testing for frequency stability was performed in the original FXCA certification.

# **MEASUREMENT UNCERTAINTIES**

Measurement uncertainties of the test facility based on a 95% confidence level are as follows,

| Test                         | Uncertainty |
|------------------------------|-------------|
| Radio frequency              | ± 0.2ppm    |
| RF power conducted           | ±1.2 dB     |
| RF power radiated            | ±3.3 dB     |
| RF power density conducted   | ±1.2 dB     |
| Spurious emissions conducted | ±1.2 dB     |
| Adjacent channel power       | ±0.4 dB     |
| Spurious emissions radiated  | ±4 dB       |
| Temperature                  | ±1°C        |
| Humidity                     | ±1.6 %      |
| Voltage (DC)                 | ±0.2 %      |
| Voltage (AC)                 | ±0.3 %      |

# EQUIPMENT UNDER TEST (EUT) DETAILS GENERAL

The equipment under test (EUT) is a Nokia Solutions and Networks Flexi Multiradio Base Transceiver Station (BTS) Radio Frequency Module (RFM) module, model FXCA which operates over 3GPP frequency band 5 (869 - 894 MHz) and band 27 (BTS transmit: 852 - 869 MHz). The FXCA has three colocated transmitters, with the option of being operated in a 4X4 MIMO configuration; with each transmit port supporting 60 watts maximum rated RF output power. The FXCA can be operated as MIMO or as non-MIMO. Multicarrier operation is supported.

The FXCA is multi-standard capable (GSM/EDGE/WCDMA/LTE), but for this effort only the LTE mode will be tested. The FXCA supports three downlink modulation types for LTE (QPSK, 16QAM and 64QAM). The FXCA supports four LTE channel bandwidths (1.4, 3, 5, 10, and 15 MHz).

The FXCA has external interfaces including DC power, ground, Antenna (TX/RX and RX), RX monitor (RXO), external alarm (EAC), and optical OBSAI (OPT). The FXCA with applicable installation kit may be pole, wall, cabinet or stack mounted.

FXCA radio certification testing is required because of extended frequency range and added LTE bandwidths (does not include any GSM or WCDMA changes) from the original certification testing. FXCA was not tested to MIMO emission levels in the original test effort. There are no hardware changes (only software changes) from the original radio certification hardware.

The FXCA channel numbers and frequencies are as follows:

|                           | Downlink         | Downlink           | LTE Channel Bandwidth |             |             |             |             |  |

Part 90 FXCA Downlink LTE Frequency Channels

The sample was received on Feb 29, 2016 and tested on March 1<sup>st</sup> – March 25<sup>th</sup>, 2016. The EUT consisted of the following component(s):

| Company         | Model | Description      | Part/Serial Number   | FCC ID/IC Number   |
|-----------------|-------|------------------|----------------------|--------------------|
| Nokia Solutions | FXCA  | Flexi Multiradio | Part#: 472142a.303   | FCC ID: VBNFXCA-01 |
| and Networks    |       | BTS RFM          | Serial#: K9144520089 | IC: 661W-FXCA      |

# **ENCLOSURE**

The EUT enclosure is made of heavy duty aluminum and measures approximately  $447(W) \times 422(D) \times 133(H)$  mm.

# **AUXILLARY EQUIPMENT**

| Company         | Model | Description         | Part/Serial Number    | FCC ID/IC Number |

# **EUT INTERFACE PORTS**

The I/O cabling configuration during testing was as follows:

| Cable       | Type   | Shield | Length | Used in Test | Quantity | Termination      |
|-------------|--------|--------|--------|--------------|----------|------------------|
| Power Input | Power  | No     | ~ 3 m  | Yes          | 1        | Power Supply     |
| Earth       | Earth  | No     | ~ 1 m  | Yes          | 1        | Lab earth ground |
| Antenna     | RF     | Yes    | ~ 3 m  | Yes          | 3        | 50Ω Load         |
| Multimode   | Optica | No     | >6 m   | Yes          | 3        | System Module    |
| Optical     | 1      |        |        |              |          |                  |

# The connector layout for FXCA is provided below:

# **FXCA** External Interfaces:

| Name  | Qty | <b>Connector Type</b> | Purpose (and Description)   |
|-------|-----|-----------------------|---|
| DC In | 1   | Multibeam             | Power Input -48 VDC   |
| GND   | 1   | Screw lug (2xM5)      | Ground  |
| ANT   | 6   | 7/16                  | RF signal for three Transmitter/Receiver (50 Ohm) and three Receive Only (50 Ohm) |
| RXO   | 6   | QMA                   | RX output for monitoring/location services  |
| Unit  | 1   | LED                   | Unit Status LED   |
| EAC   | 1   | RJ45                  | External Alarm Interface (4 alarms)   |
| OPT   | 3   | SFP+ cage             | Optical OBSAI Interface (3 Gbps)  |

# **EUT OPERATION**

During testing, the EUT was transmitting continuously with 100% duty-cycle at full power on both ports.

# **EUT FIRMWARE/SOFTWARE**

The laptop PC connects to the FSMF System Module over the LMP (Ethernet) port. The system module controls the FXCA RFM via the optical (OBSAI) interface. The laptop is used for changing configuration settings, monitoring tests and controlling the BTS. The following software versions are used for the FXCA testing:

- (1) RFM Unit Software: MED 26.01.R07
- (2) System Module Software: FL16A\_FSM3\_9999\_160112\_027599

# **MODIFICATIONS**

No modifications were made to the EUT during testing.

# **TESTING**

#### **GENERAL INFORMATION**

Antenna port measurements were taken at NTS Plano branch located at 1701 E Plano Pkwy #150 Plano, TX 75074.

Radiated spurious emissions measurements were taken at the NTS Plano Anechoic Chamber listed below. The sites conform to the requirements of ANSI C63.4-2009 American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz and CISPR 16-1-4:2007 - Specification for radio disturbance and immunity measuring apparatus and methods Part 1-4: Radio disturbance and immunity measuring apparatus Ancillary equipment Radiated disturbances. They are on file with the FCC and industry Canada.

|   | Chamber 1 | Designation Number US1077   | IC 4319A  | •  |  |  |

Considerable engineering effort has been expended to ensure that the facilities conform to all pertinent requirements.

# **MEASUREMENT PROCEDURES**

Output power, emission bandwidth, conducted spurious, conducted bandedge and carrier frequency stability measurements were all performed via a spectrum analyzer connected to the individual RF chains via a 40dB attenuator and an RF cable. The EUT was operating in 4x4 MIMO configuration at full power for all tests. All measurements were corrected for the insertion loss of the attenuator and cable inserted between the RF port of the EUT and the spectrum analyzer. Simple test diagram is shown below.

<u>Test Configuration for Antenna Port Measurements</u>

26dB emission bandwidth was measured in accordance with Section 4.1 of FCC KDB 971168 D01 v02r02. 99% occupied bandwidth was measured in accordance with Section 6.6 of RSS-Gen Issue 4. For both measurements an NTS custom software tool was used. Spectrum analyzer settings are shown on their corresponding plots in test results section.

Emissions at the band-edges were also captured with an NTS custom software tool with settings described in the corresponding sections of the FCC and IC rules. Spectrum analyzer settings are shown on their corresponding plots in test results section.

Peak and average output power measurements were performed in accordance with FCC KDB 971168 D01 v02r02. An NTS custom software tool was used for power integration to compensate for resolution bandwidth limitations of the spectrum analyzer and settings are shown on their corresponding plots in test results section.

Peak to average power ratio was calculated in accordance with Section 5.7.2 of FCC KDB 971168 D01 v02r02.

Conducted spurious emissions were captured with TILE6 software which corrected the readings for cable loss and attenuator loss across the 9kHz-9GHz frequency span. Settings of the spectrum analyzer are described in the corresponding test result section.

Transmitter radiated spurious emissions measurements were made in accordance with ANSI C63.4-2009 by measuring the field strength of the emissions from the device at 3m test distance. The eirp limit as specified in the relevant rule part(s) is converted to a field strength at the test distance and the emissions from the EUT are then compared to that limit. Only emissions within 20dB of this limit are subjected to a substitution measurement in accordance with TIA-603-C-2004. Both preliminary and final measurements were performed at the same FCC listed test chamber. Preliminary scans were performed with TILE6 software. This software corrected the measurements for antenna factors, cable losses and pre-amplifier gains. Both polarizations of the receiving antenna were scanned from 30MHz to 9GHz with a peak detector (RBW=100kHz,

VBW=300kHz, with trace max hold over multiple sweeps). Based on the preliminary scan results, frequencies of interest have been maximized via rotating the EUT 360 degrees and varying the height of the test antenna (1m to 4m). Final measurements were also taken with the peak detector as described above. A biconilog antenna was used for 30MHz-1GHz range. A double ridged waveguide horn antenna was used for 1-9GHz range. The antennas used to measure the radiated electric field strength are mounted on a non-conductive antenna mast equipped with a motor-drive to vary the antenna height. EUT was placed on a non-conductive RF transparent structure to provide 80cm height from the ground floor. A motorized turntable allowed it to be rotated during testing to determine the angle with the highest level of emissions.

# Appendix A Part 22 Test Data

# **RF Output Power**

RF output power has been measured in both Peak and RMS Average terms for each transmit chain at center channel for all modulations and bandwidth modes. Peak to average ratio (PAR) has been calculated as described in Section 5.7.2 of KDB971168 D01 v02r02 and all results are presented in tabular form below.

|          |      | LTE - QPSK |         | L    | LTE - 16QAM |         |      | LTE - 64QAM |         |      |
|----------|------|------------|---------|------|-------------|---------|------|-------------|---------|------|

Based on the results above, Port 1 had the highest RMS average power and therefore it was selected for all the remaining LTE mode antenna port tests on the product.

Subsequently output power levels on lowest and highest channels were tested only on Port 1 and results presented below.

|         |      | LTE - QPSK |         |      | LTE - 16QAM |         |      | LTE - 64QAM |         |      |

## Antenna Port Conducted Bandedge

Limit is -13dBm and is further reduced by 10\*log(4) per FCC KDB 662911D01 v02r01 due to 4x4 MIMO operation, which brings it down to -19.03dBm.

Tests performed at Port 1 on lowest and highest channels for all modulations and channel bandwidth modes.

Measurements were performed in RMS average mode with 100kHz RBW and 300kHz VBW over 100 traces. In 1MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of 1% of the emission bandwidth has been used.

Total path loss of 40.8dB accounted in via reference level offset to the spectrum analyzer.
