5.6. TOTAL INPUT POWER TO THE FINAL RADIO FREQUENCY STAGE OF AMPLIFIER [47 CFR 15.219 (a)]

5.6.1. Limits

(a) The total input power to the final radio frequency stage (exclusive of filament or heater power) shall not exceed 100 milliwatts.

Note:- The following measurements and test results were supplied by the manufacturer and are copied here to show compliance with this requirement.

5.6.2. Over View

It can be proven mathematically that maximum power is delivered across the load when the effective load resistance presented by the final amplifier (the voltage across the final amplifier divided by the current) is equal to R. If an equivalent resistance equal to R is added between a power supply set at double the voltage across the final amplifier, then automatic power regulation is achieved.

Through experimentation, it was found that the final output stage in the AMTX100 transmitter works most efficiently when 2.5V is applied resulting in a current flow of 40mA. This is an input power of 100mW and a resulting final resistance of 62.5 ohms (R).

If the external voltage source is doubled to 5V and a series resistor equivalent to 62.5 ohms is added then 100mW will be maintained across all frequencies.

Through experimentation, it was found that 82 ohms was the best choice to maintain final amplifier input power <u>under</u> 100mW.

5.6.3. Test Diagram

Fig - Final output stage configuration

5.6.4. Test Data

The following measurements were made at the low (1290kHz), mid (1500kHz) and high (1700kHz) frequency ranges of the AMTX100 transmitter with the antenna tuned to resonance (maximum power).

At 1290 kHz:

Voltage across FIN+ and FIN- = 2.096V Current through R = 25.56mA Voltage at FIN- wrt ground = 3.536V Power input to final amplifier = 90.4mW

At 1500 kHz:

Voltage across FIN+ and FIN- = 2.373V Current through R = 28.93mA Voltage at FIN- wrt ground = 3.229V Power input to final amplifier = 93.4mW

At 1700 kHz:

Voltage across FIN+ and FIN- = 2.376V Current through R = 28.97mA Voltage at FIN- wrt ground = 3.239V Power input to final amplifier = 93.85mW

5.7. TOTAL LENGTH OF THE ANTENNA, TRANSMISSION LINE & GROUND LEAD [47 CFR 15.219 (b)]

5.7.1. Limits

(b) The total length of the transmission line, antenna and ground lead (if used) shall not exceed 3 meters.

5.7.2. Results

The manufacturer ChezRadio has confirmed that the installation will meet the above requirement and listed as a warning statement on page no.3 of the user manual as per below.

Warning: FCC rules (47 part 15.219) state:" the total length of the transmission line, antenna and ground lead (if used) shall not exceed 3 meters." [3 meters = 118 inches]

The PROCASTER[™] has an attached 103 inch antenna measured from its tip to the lower mounting bolt which is the connection of the transmitter output. It has no transmission line. A 15 inch maximum ground lead is allowed from the grounding lug to a massive ground.

5.8. FIELD STRENGTH OF EMISSIONS INSIDE & OUTSIDE THE PERMITTED BAND 510-1705 kHz [47 CFR 15.219 (c)]

5.8.1. Limits

(c) All emissions below 510 kHz or above 1705 kHz shall be attenuated at least 20 dB below the level of the unmodulated carrier. Determination of the compliance with the 20 dB attenuation specification may be based on the measurements at the intentional radiator's antenna output terminal unless the intentional radiator uses a permanently attached antenna, in which case compliance shall be demonstrated by measuring the radiated emissions.

Refer to Ultratech Test Procedures, File # ULTR P001-2004 and ANSI C63.4 for measurement methods

Applies to harmonics/spurious that fall in the restricted bands listed in Section 15.205. the maximum permitted average field strength is listed in Section 15.209. A Pre-Amp and high-pass filter are used for this measurement.

- For measurements from 9 KHz to 150 KHz, set RBW = 200 Hz, VBW ≥ RBW, SWEEP=AUTO.
- For measurements from 150 KHz to 30 MHz, set RBW = 10 KHz, VBW ≥ RBW, SWEEP=AUTO.
- For measurements from 30 MHz to 1 GHz, set RBW = 100 KHz, VBW > RBW, SWEEP=AUTO.
- For measurement above 1 GHz, set RBW = 1 MHz, VBW = 1 MHz, SWEEP=AUTO.

If the emission is pulsed, modified the unit for continuous operation, then use the settings above for measurements, then correct the reading by subtracting the peak-average correction factor derived from the appropriate duty cycle calculation. See Section 15.35(b) and (c).

EXHIBIT 6. MEASUREMENT UNCERTAINTY

The measurement uncertainties stated were calculated in accordance with the requirements of NIST Technical Note 1297 and LAB 34.

| LISN coupling specification | Rectangular | <u>+</u> 1.5 | <u>+</u> 1.5 | |
| Cable and Input Transient Limiter calibration | Normal (k=2) | <u>+</u> 0.5 | | |
| Mismatch: Receiver VRC $\Gamma_1 = 0.03$ LISN VRC $\Gamma_R = 0.8(9 \text{ kHz}) 0.2 (30 \text{ MHz})$ Uncertainty limits $20\text{Log}(1\pm\Gamma_1\Gamma_R)$ | U-Shaped | <u>+</u> 0.2 | <u>+</u> 0.3 | |

Sample Calculation for Measurement Accuracy in 450 kHz to 30 MHz Band:

 $u_{c}(y) = \sqrt{\sum_{i=1}^{m} \sum_{u_{i}^{2}(y)} u_{i}^{2}(y)} = \pm \sqrt{(1.5^{2} + 1.5^{2})/3 + (0.5/2)^{2} + (0.05/2)^{2} + 0.35^{2}} = \pm 1.30 \text{ dB}$ $U = 2u_{c}(y) = \pm 2.6 \text{ dB}$
