

From the updated photo, I am unable to determine the type of connection for the mouse (USB, PS2, Serial). Additionally, the mouse should be 10 cm from the keyboard per C63.4 figure 13. Section 11.2.3, while technically for conducted emissions, is also a good guide for radiated emissions. Please use that as a guide for future device submissions.

Kindly note that the EUT connects via USB. Also C63.4 clearly cites 2 different types of connections should be used (see section 11.1.1.2). If the mouse connects via USB, then this requirement was not met.

We have added 2 setup photos for Radiated Emission test.

The Test Setup photos were uploaded to website.

And we have redone the Radiated Emission test.

The revised test report was uploaded to website.
