### 1.2 Standard Applicable

According to $\S 1.1307(b)(1)$ and KDB 447498 D01 General RF Exposure Guidance v06, system operating under the provisions of this section shall be operating in a manner that the public is not exposed to radio frequency energy level in excess limit for maximum permissible exposure.
(a) Limits for Occupational / Controlled Exposure

| Frequency range <br> $(\mathrm{MHz})$ | Electric Field <br> Strength (E) <br> $(\mathrm{V} / \mathrm{m})$ | Magnetic Field <br> Strength (H) <br> $(\mathrm{A} / \mathrm{m})$ | Power Density <br> $(\mathrm{S})\left(\mathrm{mW} / \mathrm{cm}^{2}\right)$ | Averaging Times <br> $\|\mathrm{E}\|^{2},\|\mathrm{H}\|^{2}$ or <br> $\mathrm{S}($ minutes $)$ |

| $1500-100000$ | $/$ | $/$ | 1 | 30 |

Note: $\mathrm{f}=$ frequency in $\mathrm{MHz}:$ * = Plane-wave equivalents power density

### 1.3 MPE Calculation Method

$\mathrm{S}=(30 * \mathrm{P} * \mathrm{G}) /\left(377 * \mathrm{R}^{2}\right)$
$\mathrm{S}=$ power density (in appropriate units, e.g., mw/ $\mathrm{cm}^{2}$ )
$\mathrm{P}=$ power input to the antenna (in appropriate units, e.g., mw)
$\mathrm{G}=$ power gain of the antenna in the direction of interest relative to an isotropic radiator,
the power gain factor is normally numeric gain.
$\mathrm{R}=$ distance to the center of radiation of the antenna (in appropriate units, e.g., cm )

### 1.4 MPE Calculation Result

Maximum Tune-Up output power: $\underline{15(\mathrm{dBm})}$
Maximum peak output power at antenna input terminal: $\underline{31.62(\mathrm{~mW})}$
Prediction distance: $>20(\mathrm{~cm})$
Prediction frequency: 2462 (MHz)
Antenna gain:3.0(dBi)
Directional gain (numeric gain): $\underline{2.00}$
The worst case is power density at prediction frequency at $20 \mathrm{~cm}: \underline{0.0126\left(\mathrm{mw} / \mathrm{cm}^{2}\right)}$
MPE limit for general population exposure at prediction frequency: $1\left(\mathrm{mw} / \mathrm{cm}^{2}\right)$

Result: Pass
