FCC Part 15.249(d)

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in Section 15.209, whichever is the lesser attenuation.

Remark:

The fundamental frequency of the EUT is 2410MHz , 2440MHz and 2470MHz.

The limit for average field strength dBuv/m for the fundamental frequency = 94.0 dB μ V/m.

The limit for peak field strength dBuv/m for the fundamental frequency = $114.0 \text{ dB}\mu\text{V/m}$.

Report No.: GLEMR070701944RFT-2 Page: 8 of 19

No fundamental is allowed in the restricted bands.

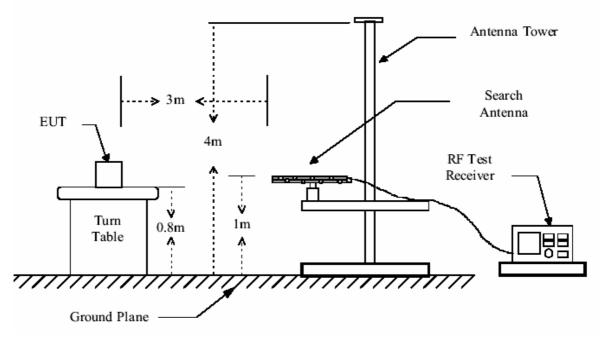

The limit for average field strength $dB\mu V/m$ for the harmonics = 54.0 $dB\mu V/m$.

The limit for peak field strength $dB\mu V/m$ for the harmonics = 74.0 $dB\mu V/m$.

Emission radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50dB below the level of the fundamental or 54.0 dB μ V/m in 15.209. Here the limit for the other emission is 54.0 dB μ V/m.

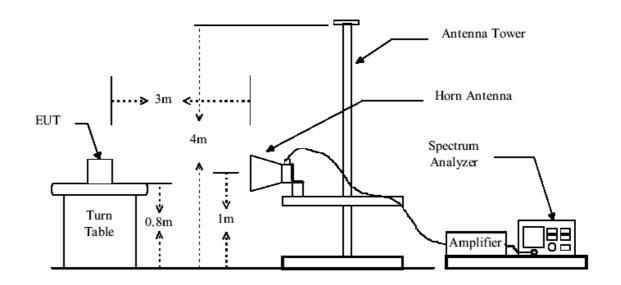

Test Procedure: The procedure used was ANSI Standard C63.4-2003. The receiver was scanned from 30MHz to 25GHz. When an emission was found, the table was roated to produce the maximum signal strength. An initial pre-scan was performed for in peak detection mode using the receiver. The EUT was measured for both the Horizontal and Vertical polarities and performed a pre-test three orthogonal planes. For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. The worst case emissions were reported.

Test Configuration:

Report No.: GLEMR070701944RFT-2 Page: 9 of 19

The field strength is calculated by adding the Antenna Factor, Cable Factor & preamplifier. The basic equation with a sample calculation is as follows:

Final Test Level = Receiver Reading + Antenna Factor + Cable Factor – preamplifier Factor

The following test results were performed on the EUT:

|-------------------|---|
| Test Method: | ANSI C63.4 |
| Test Date: | 12 July 2007 |
| Frequency Range: | 150KHz to 30MHz |
| Class / Severity: | Class B |
| Detector: | Peak for pre-scan (9kHz Resolution Bandwidth) |
| | Quasi-Peak if maximised peak within 6dB of Quasi-Peak limit |
