Environmental evaluation and exposure limit according to FCC CFR 47part 1, §1.1307, §1.1310

Limit for power density for general population/uncontrolled exposure is 1 mW/cm² for 1500 -100000 MHz frequency range:

The power density P (mW/cm²) = P_T / 4π r², where

 P_{T} is the maximum equivalent isotropically radiated power (EIRP).

To confirm compliance with a safe distance for base station fixed unit the following calculation was done:

The peak output power of 26.56 dBm with 16 dBi antenna gain corresponds to the equivalent isotropically radiated power (EIRP) of

26.56 dBm + 16 dBi = 42.56 dBm, which is equal to 18030 mW.

The minimum safe distance "r", where RF exposure does not exceed FCC permissible limit, is

$$r = sqrt \{ PT / (Px4\pi) \} = sqrt \{ 18030 / 12.56 \} = 38 cm << 2 m.$$

General public cannot be exposed to dangerous RF level.
