

**Environmental evaluation and exposure limit according to FCC CFR 47part 1,
§1.1307, §1.1310**

Limit for power density for general population/uncontrolled exposure is 1 mW/cm² for 1500 -100000 MHz frequency range:

The power density P (mW/cm²) = $P_T / 4\pi r^2$, where

P_T is the maximum equivalent isotropically radiated power (EIRP).

To confirm compliance with a safe distance for base station fixed unit the following calculation was done:

The peak output power of 26.3 dBm with 16 dBi antenna gain corresponds to the equivalent isotropically radiated power (EIRP) of

$$26.3 \text{ dBm} + 16 \text{ dBi} = 42.3 \text{ dBm}, \text{ which is equal to } 16982 \text{ mW}.$$

The minimum safe distance "r", where RF exposure does not exceed FCC permissible limit, is

$$r = \sqrt{P_T / (P \times 4\pi)} = \sqrt{16982 / 12.56} \approx 37 \text{ cm} \ll 2 \text{ m} .$$

General public cannot be exposed to dangerous RF level.
