

## **The principles of ELAMMD Motor Part**

This machine equipped with Switching power supply (DC16V, 500mA) . Through this machine output two voltages, one through the power tube to supply lights, another through the regulator circuit output 3.2 supply to the receiver power. This machine demodulate the code from the remote to output high potential and low potential for controlling dynatron, make the lights to flash. Under current 1000mA for maximum.
