All GPIO can be source to wake up MCU from shut down state. In shut down state, any level change on the set GPIO will trigger the wake up procedure.

When power on, the default state of GPIO0~GPIO9 and GPIO12~GPIO20 is high impedance and pull low internally; the default state of GPIO10~GPIO11 is high impedance and pull high; and the default state of GPIO21 is high impedance only.

### **3.2. PWM Timer and Watch Dog Timer**

There are two sets of PWM timers. One fast set uses 1 MHz clock as main clock, and another slow set uses 32 kHz clock as main clock. Each set has three 16 bits counter with 4 bit pre-divider. First two timers in slow set can be used to LED duty cycle control.

The watch dog timer runs with 32 kHz clock, with period from 0.6 ms to 38 second.

### **3.3. Power Management**

The BK8008 supports USB power supply that it can work without battery. When there is a USB power supply, it will charge the battery with automatically charge current control while provide power to the BK8008. The buck will give nearly half current reduction for digital power.

The BK8008 can enter into shut down mode when there is no active connection. The shut mode can be waked up by GPIO and USB charge.

### **3.4. MCU**

The 16 bit RISC MCU has 16 KB I-Cache and DMA bus, to support efficient execution and frequently data exchange. The JTAG interface can be used to on-line debug, which can be also configured as GPIO.

Besides 26 MHz crystal, the MCU can run with internal programmable ROOSC clock, or 32 kHz ring oscillator clock, with programmable divided ratio.

### **3.5. I2C and UART Interface**

There is one set of I2C interface and one set of UART interface for debug or external MCU control the BK8008. They share the two same GPIO0 and GPIO1.

### **3.6. FM Receiver Control Interface**

The FM receiver control interface consists of a two-wire I2C interface and a 13 MHz clock for FM receiver reference.

### 3.7. FLASH Access Interface

The BK8008 MCU is running with the external FLASH program memory and the internal instruction cache. The external FLASH can be also used to store user data such as key configuration and Bluetooth pairing information.

### 3.8. SPI

The 4-wires SPI supports high speed data communication, which can be used as interface to either external FLASH or LCD controller.

### 3.9. SAR ADC and LED

The SAR ADC has 10-bit resolution, and the two LED drivers support up to 10 mA current.

The SAR has six active channel as follows.

**Table 3 ADC Channel Table**

Channel Number	Detected Voltage	Description
1	VBAT-pin/4	Battery voltage
2	VADC-pin	Pin VADC voltage
3	Charge current detector	Used to detect charge current and charge circuit control
4	VCC5USB-pin/6	USB voltage
5	GPIO19	GPIO19 voltage
6	GPIO9	GPIO9 voltage

### 3.10. Audio Peripheral

There are one set of speech ADC with sample rate 8 kHz or 16 kHz, 44.1 kHz or 48 kHz. The DAC have two channels for stereo application, with sample rate 8 kHz, 16 kHz, 44.1 kHz or 48 kHz.

There is also a stereo line in interface, to allow external stereo input passing internal 31 dB programmable gain amplify to stereo output.
