

TCB: As the margin in spurious emission measurements is less than the difference in antenna gains between the antenna used in testing and the antenna supplied with the end product, please confirm that you have verified that there were no emission peaks hiding just below the noise floor.

A: We have completed conducted measurements during development that show that the spectrum is clean with the exception of the actual carrier. As the antenna is passive and can only contribute to a genuine emission from the transmitter, we are confident that there is nothing hiding in the noise floor.
