According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance  $\leq 50$  mm are determined by:

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$$

The tune-up power is 4 dBm +/- 1dB, therefore the highest tune-up power is 5.0 dBm (3.16 mW) @ 2480 MHz

When the minimum *test separation distance* is  $< 5$  mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

$$(3.16\text{mW} / 5\text{mm}) \cdot (2.480\text{GHz}^{0.5}) = 1.0$$
$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] = 1.0 < 3.0$$

Therefore, standalone SAR measurements are not required for both head and body.
