RADIO TEST REPORT

Test Report No. : 31HE0183-HO-01-B

Applicant	:	Murata Manufacturing Co., Ltd	
Type of Equipment	:	Wireless LAN Module	
Model No.	:	LBWA1ZZUN1	
FCC ID	:	VPY-LBUN	
Test regulation	:	FCC Part 15 Subpart E: 2010	
Test Result	:	Complied	

- 1. This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc.
- 2. The results in this report apply only to the sample tested.
- 3. This sample tested is in compliance with above regulation.
- 4. The test results in this report are traceable to the national or international standards.
- 5. This test report must not be used by the customer to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the Federal Government.

Date of test:

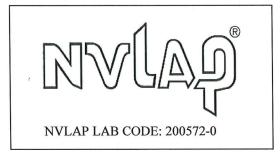

May 7 to 20, 2011

Representative test engineer:

Yutaka Yoshida Engineer of WiSE Japan, UL Verification Service

Approved by :

Takahiro Hatakeda Engineer of WiSE Japan, UL Verification Service

This laboratory is accredited by the NVLAP LAB CODE 200572-0, U.S.A. The tests reported herein have been performed in accordance with its terms of accreditation. *As for the range of Accreditation in NVLAP, you may refer to the WEB address, http://www.ul.com/japan/jpn/pages/services/emc/about/ma rk1/index.jsp#nvlap

FCC 15.31 (e)

The RF Module has its own regulator.

The RF Module is constantly provided voltage (DC3.3V/1.2V) through own regulator regardless of input voltage. Therefore, this EUT complies with the requirement.

FCC Part 15.203/212 Antenna requirement

It is impossible for end users to replace the antenna, because it is soldered on the circuit board. Therefore the equipment complies with the requirement of 15.203/212.

SECTION 4: Operation of E.U.T. during testing

4.1 Operating Modes

Test operating mode was determined as follows according to "Section 1 of 6 802.11 a/b/g/n testing - Managing Complex Regulatory Approvals - " of TCB Council Workshop October 2009.

Mode	Remarks*			
IEEE 802.11a (11a)	9Mbps, PN9			
IEEE 802.11n MISO 20MHz BW (11n-20)	MCS 3, PN9			
IEEE 802.11n MISO 40MHz BW (11n-40)	MCS 7, PN9			
*The worst condition was determined based on the test result of Maximum Peak Output Power (Mid Channel)				
*This EUT has two antennas, but it transmits with sin	gle antenna and does not transmit with multi antennas.			

Power of the EUT was set by the software as follows:

Software name & version: USB Driver Version 5.100

[Power Setting]

ch	36	38	40-60	62	64	100	102	104-140	149-165

11nHT40	-	9.5	11.5	11.5	-	-	10.5	13	14.5

*The above setting of the software is the worst case. Any conditions under the normal use do not exceed the condition of setting. In addition, end users cannot change the settings of the output power of the product.

4.2 Configuration and peripherals

* Cabling and setup(s) were taken into consideration and test data was taken under worse case conditions.

* It was confirmed there was no difference in emission levels due to a ferrite core attached on cable 2 and 2'

SECTION 5: Conducted Emission

Test Procedure

EUT was placed on a urethane platform of nominal size, 1.0m by 0.5m, raised 0.8m above the conducting ground plane. The rear of tabletop was located 40cm to the vertical conducting plane. The rear of EUT, including peripherals aligned and flushed with rear of tabletop. All other surfaces of tabletop were at least 80cm from any other grounded conducting surface. EUT was located 80cm from a Line Impedance Stabilization Network (LISN)/ Artificial mains Network (AMN) and excess AC cable was bundled in center.

1) For the tests on EUT with other peripherals (as a whole system)

I/O cable and AC cables that were connected to the peripherals were bundled in center. They were folded back and forth forming a bundle 30cm to 40cm long and were hanged at a 40cm height to the ground plane. All unused 50ohm connectors of the LISN(AMN) were resistivity terminated in 50ohm when not connected to the measuring equipment.

The AC Mains Terminal Continuous disturbance Voltage has been measured with the EUT in a Semi Anechoic Chamber or a Measurement Room.

The EUT was connected to a LISN (AMN).

An overview sweep with peak detection has been performed.

SECTION 6: Radiated Spurious Emission and Band Edge Compliance

Test Procedure

EUT was placed on a urethane platform of nominal size, 1.0m by 0.5m, raised 0.8m above the conducting ground plane.

The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with a ground plane.

The height of the measuring antenna varied between 1 and 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.

The measurements were made with the following detector function of the test receiver and the Spectrum analyzer (in linear mode).

The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver, or the Spectrum Analyzer.

The test was made with the detector (RBW/VBW) in the following table.

When using Spectrum analyzer, the test was made with adjusting span to zero by using peak hold.

Below 1GHz

The result also satisfied with the general limits specified in section 15.209(a).

Above 1GHz

Inside of restricted bands(Section 15.205):	Apply to limit in the Section 15.209(a).
Outside of the restricted bands:	Apply to limit 68.2dBuV/m(–27dBm e.i.r.p. [*])
	in the Section $15.407(b)(1)(2)(3)$.
Restricted bandedge:	Average detector apply to limit in the Section 15.209(a).
	Peak detector apply to limit 68.2dBuV/m(-27dBm) e.i.r.p.
	in the Section $15.407(b)(1)(2)(3)$. since this limit is
	severer than the limit of the inside of restricted bands.

*Electric Field Strength to e.i.r.p. Conversion

 $E = \frac{1000000\sqrt{30P}}{(\text{uV/m})}$ (uV/m) :P is the e.i.r.p. (Watts)

Test Antennas are used as below;

Frequency	Below 30MHz	30MHz to 300MHz	300MHz to 1GHz	Above 1GHz
Antenna Type	Loop	Biconical	Logperiodic	Horn

Frequency	Below 1GHz	Above 1GHz		
Instrument used	Test Receiver	Spectrum Analyzer		
Detector	QP	PK AV		
IF Bandwidth	BW 120kHz(T/R)	RBW: 1MHz	RBW: 1MHz	
		VBW: 3MHz	VBW: 10Hz*1)	
Test Distance	3m	3m (below 10GHz)		
		1m*3) (above 10GHz)		
		0.5m *3) (above 26.50	SHz)	

*1) The test was performed with VBW 10Hz since the EUT had no intervals during which the transmitter was off for the burst rate (see Appendix).

*2) Distance Factor: $20 \times \log (3.0m/1.0m) = 9.5 dB$

*3) Distance Factor: $20 \times \log (3.0 \text{m}/0.5 \text{m}) = 15.6 \text{dB}$

- The carrier level and noise levels were confirmed at each position of X, Y and Z axes of EUT to see the position of maximum noise, and the test was made at the position that has the maximum noise.

The test results and limit are rounded off to one decimal place, so some differences might be observed.

*2) In the frequency range below 30MHz, RBW was narrowed to separate the noise contents. Then, wide-band noise near the limit was checked separatel however the noise was not detected as shown in the chart.(9kHz-150kHz:RBW=200Hz, 150kHz-30MHz:RBW=9.1kHz)

*EBW: Enough width to display Bandwidth

The test results and limit are rounded off to two decimals place, so some differences might be observed.
