## Test Method

Substitution method is used for this test.
a) EUT is set on non-conducting table and the output power is set to the maximum level.

c) Maximum peak power is measured by a spectrum analyzer(SA) in below conditions.

Turntable is rotated 360 degrees.
The height of receive antenna is changed from 1 m to 4 m .
Receive antenna polarization is set to vertical and horizontal.
This maximum peak power is recorded.
During this measurement, receive antenna is adjusted the direction to keep the EUT within the beamwidth of receive antenna.
d) Reference antenna is replaced with EUT, and connected with signal generator(SG).

SG output power is adjusted to get same level as the recorded maximum radiated EUT power by SA.
e) Radiated output power (Pout) is calculated with adjusted SG output (Psg) [dBm], reference antenna gain (Gref) [dBi] and cable loss between SG and reference antenna (Lcab) [dB].

$$
\text { Pout }[\text { dBm e.i.r.p }]=\text { Psg }+ \text { Gref }+ \text { Lcab }

Ambient Temperature: -
Relative humidity: -

## Test Method

Substitution method is used for this test.
a) EUT is set on non-conducting turntable and the output power is set to the maximum level.
b) As a receive antenna, Horn antenna is used for high frequency range (above 1 GHz ), and Bilogical antenna is used for low frequency range ( 30 MHz to 1 GHz ).
c) The maximum level of each spurious emission is measured by a spectrum analyzer(SA) in below conditions.

Turntable is rotated 360 degrees.
The height of receive antenna is changed from 1 m to 4 m .
Receive antenna polarization is set to vertical and horizontal.
EUT was placed at three different orientations ( $\mathrm{X}, \mathrm{Y}$ and Z axis) in order to find the worst orientation. This emission level is recorded.
During this measurement, receive antenna is adjusted the direction to keep the EUT within the beamwidth of receive antenna.
d) Reference antenna is replaced with EUT, and connected with signal generator(SG).

SG output power is adjusted to get same level as the recorded maximum radiated EUT power by SA.
e) Radiated output power (Pout) is calculated with adjusted SG output (Psg) [dBm], reference antenna gain (Gref) [dBd] and cable loss between SG and reference antenna (Lcab) [dB].
Pout [dBm e.r.p] = Psg + Gref + Lcab
