Declaration of FCC 15.407 (c) requirement.

We had declared that Both AMN11310 & AMN12310 will meet 15.407(c) requirement by means of below operation.

The WHDI transmitter automatically ceases transmission in one of the following cases:

1. It is being instructed to cease transmission by higher level (application)
2.
3. No receiver has sent a keep alive message in a certain timeout – in this case the transmitter deduces that no receiver is tuned to its frequency and ceases its transmission

4. No A/V data is present at its inputs, and there's no control information to transmit. In this case the transmitter ceases transmission. It will set up a new communication channel, when it has information to transmit once again.
