1 INFORMATION

1.1 Test Item

Name	TRON
FCC ID	VRVTRONTR30AIR
Model/version	TR30 AIR
Serial number	314
Hardware identity and/or version	R1844
Software identity and/or version	3.2.0 AIR
Frequency Range	121.5 MHz / 123.1 MHz
Number of Channels	2
Type of Modulation	A3E (Amplitude Modulation)
User Frequency Adjustment	Selectable 121.5 MHz or 123.1 MHz
Type of Power Supply	Primary Battery (Lithium Iron Disulphide Battery, 6VDC, 2900 mAh)
Antenna Connector	SMA
Antenna	Antenna TR30 AIR
Desktop Charger	N/A

Theory of Operation

The EUT is a Maritime Aeromobile Emergency Radio with 121.5 MHz and 123.1 MHz.

1.2 Normal test condition

Temperature:	20 - 25 °C
Relative humidity:	30 - 50 %
Normal test voltage:	6.0 V _{DC} (Nominal Voltage)

The values are the limit registered during the test period. All tests except the Frequency Stability Test, were performed with a fully charged battery. The Frequency stability test was performed with a regulated DC Power Supply.

1.3 Test Engineer(s)

Frode Sveinsen

1.4 Test Equipment

See list of test equipment in clause 5.

1.5 Comments

The EUT is pre-programmed with 121.5 MHz and 123.1 MHz, it's not possible to select any other frequencies. All ports were populated during spurious emission measurements.

2 TEST REPORT SUMMARY

2.1 General

All measurements are tracable to national standards.

The tests were conducted for demonstrating compliance with FCC CFR 47 Part 80 and ISED Canada RSS-141 Issue 2 and RSS-GEN Issue 5.

Radiated tests were conducted in accordance with ANSI C63.4-2014.

Radiated tests were made in a semi-anechoic chamber at measuring distance of 3m.

A description of the test facility is on file with the FCC and ISED Canada.

3 TEST RESULTS

3.1 **RF Output Power, Conducted**

FCC §2.1046, 80.215

Test Results: Complies

Measurement Data:

Frequency (MHz)	Measured Value (dBm)	Measured Value (Watts)		
121.500	24.7	0.295		
123.100	24.8	0.302		

The EUT always transmits at maximum output power.

This measurement was performed with an Average Power Meter.

The measurement is performed with the the EUT transmitting continuously modulated with a 2.5 kHz audio signal at input level 16 dB above the level that produce modulation index 50%.

Requirements:

§2.1046 (a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in §2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(b) For single sideband, independent sideband, and single channel, controlled carrier radiotelephone transmitters the procedure specified in paragraph (a) of this section shall be employed and, in addition, the transmitter shall be modulated during the test as follows. In all tests, the input level of the modulating signal shall be such as to develop rated peak envelope power or carrier power, as appropriate, for the transmitter.

(6) Single-channel controlled-carrier transmitters in the A3 emission mode—by a 2500 Hz tone.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations.

§80.215 (a) Transmitter power shown on the radio station authorization is the maximum power the licensee is authorized to use. Power is expressed in the following terms:

(5) For all other emissions: the carrier power multiplied by 1.67.

3.2 Modulation Characteristics

3.2.1 Audio Frequency Response

FCC §2.1047, §80.213

Test Results: Complies

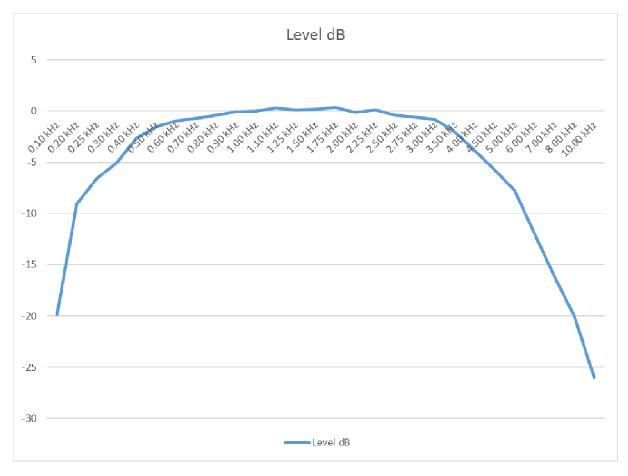

Measurement Data:

See attached graph.

Reference Level is 1000 Hz tone at 50% Modulation

Requirements:

§2.1047 (a) *Voice modulated communication equipment*. A curve or equivalent data showing the frequency response of the audio modulating circuit over a range of 100 to 5000 Hz shall be submitted. For equipment required to have an audio low-pass filter, a curve showing the frequency response of the filter, or of all circuitry installed between the modulation limiter and the modulated stage shall be submitted.

Audio Frequency Response

3.2.2 Modulation Limiting

FCC §2.1047, 80.213

Test Results: Complies

Measurement Data:

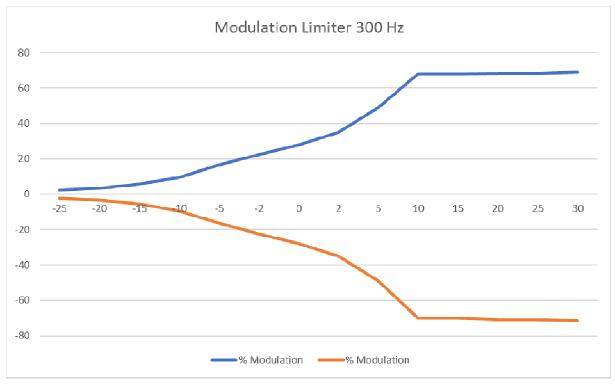

See attached graph.

Requirements:

§2.1047 (b) *Equipment which employs modulation limiting.* A curve or family of curves showing the percentage of modulation versus the modulation input voltage shall be supplied. The information submitted shall be sufficient to show modulation limiting capability throughout the range of modulating frequencies and input modulating signal levels employed.

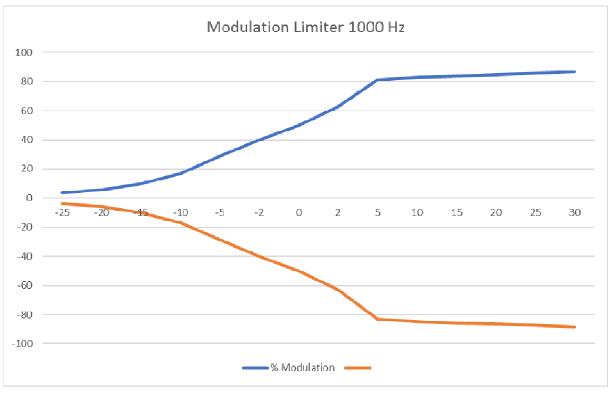

\$80.213 (a) Transmitters must meet the following modulation requirements:

(1) When double sideband emission is used the peak modulation must be maintained between 75 and 100 percent

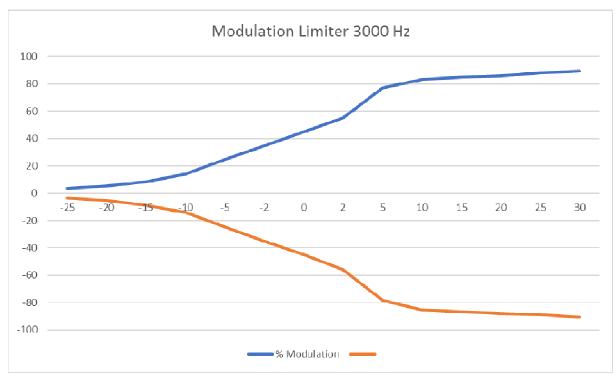

Modulation Limiter, 300 Hz (x-axis: Voltage, dB)

Modulation Limiter, 1000 Hz (x-axis: Voltage, dB)

Modulation Limiter, 3000 Hz (x-axis: Voltage, dB)

3.3 Occupied Bandwidth

FCC §2.1049, §80.205

Test Results: Complies

Measurement Data:

Transmit Frequency	Occupied Bandwidth (kHz)
121.500 MHz	5.18
123.100 MHz	5.18

See plots

For this test the EUT was transmitting continuously.

The EUT was modulated by a 2.5 kHz signal and the input level was adjusted to 16 dB above the level that produced 50% modulation.

Requirements:

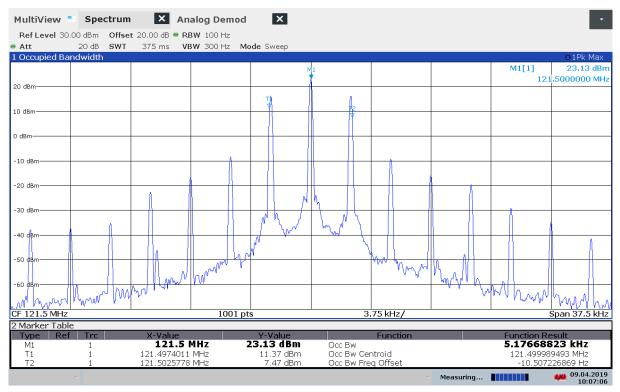

§2.1049 The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

(c) Radiotelephone transmitters equipped with a device to limit modulation or peak envelope power shall be modulated as follows. (1) Other than single sideband or independent sideband transmitters—when modulated by a 2500 Hz tone at an input level 16 dB greater than that necessary to produce 50 percent modulation. The input level shall be established at the frequency of maximum response of the audio modulating circuit.

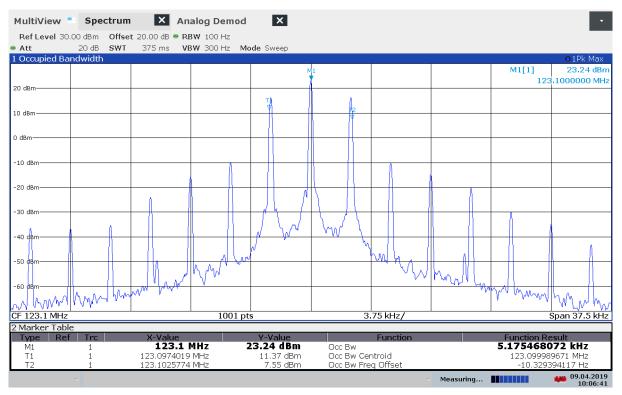

§80.205 (a) An emission designator shows the necessary bandwidth for each class of emission of a station except that in ship earth stations it shows the occupied or necessary bandwidth, whichever is greater. The following table gives the class of emission and corresponding emission designator and authorized bandwidth:

Class of emission	Emission designator	Authorized bandwidth (kHz)		
A3E	6K00A3E	8.0		

99% Bandwidth, 121.5 MHz, Audio Freq: 2500Hz, Modulation 16dB above 50%

99% Bandwidth, 123.1 MHz, Audio Freq: 2500Hz, Modulation 16dB above 50%

3.4 Spurious Emissions at Antenna Terminals

FCC §2.1051, 80.211(f), 2.1057

Test Results: Complies

Measurement Data:

See plots

Authorized Bandwidth = 8 kHz

For this test the EUT was transmitting continuously.

The EUT was modulated by a 2.5 kHz signal and the input level was adjusted to 16 dB above the level that produced 50% modulation.

Requirements:

§2.1051 The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in §2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

§2.1057 (a) In all of the measurements set forth in §§2.1051 and 2.1053, the spectrum shall be investigated from the lowest radio frequency signal generated in the equipment, without going below 9 kHz, up to at least the frequency shown below:

(1) If the equipment operates below 10 GHz: to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

(b) Particular attention should be paid to harmonics and subharmonics of the carrier frequency as well as to those frequencies removed from the carrier by multiples of the oscillator frequency. Radiation at the frequencies of multiplier stages should also be checked.

(c) The amplitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be reported. **§80.211** The emissions must be attenuated according to the following schedule.

(f) The mean power when using emissions other than those in paragraphs (a), (b), (c) and (d) of this section:

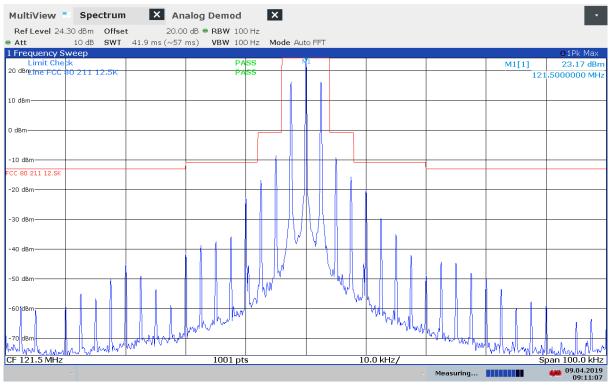

(1) On any frequency removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: At least 25 dB;

(2) On any frequency removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: At least 35 dB; and

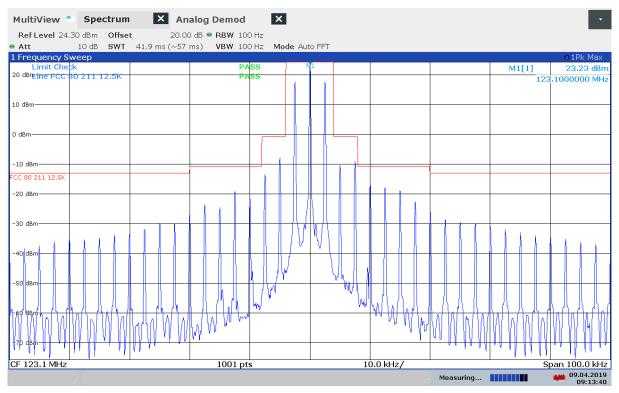

(3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least 43 plus 10log₁₀ (mean power in watts) dB.

Frequency Range	Limit, §80.211(f)
More than 4 kHz and less than 8 kHz from Nominal Frequency	At least 25 dB below carrier
More than 8 kHz and less than 20 kHz from Nominal Frequency	At least 35 dB below carrier
More than 20 kHz from Nominal Frequency	At least 43 + 10 log ₁₀ (Mean Power in Watts) dB below carrier

# 3.5 Field Strength of Spurious Radiations

FCC §2.1053, 2.1057, 80.211(f)

**Test Results: Complies** 

#### **Measurement Data:**

Carrier Frequency (MHz)	Spurious Frequency (MHz)	Measured Field Strength (dBµV/m @3m)	Calculated Radiations (dBm)	Limit (dBm)	Margin (dB)
121.500	121.500	113.2	18.0	/	/
121.500	243.0	32.2	-63.0	-13	50.0
	486.0	32.2	-63.0	-13	50.0
	850.5	37.9	-57.3	-13	44.3
	972.0	42.8	-52.4	-13	39.4
123.100	123.100	114.9	19.7	/	/
123.100	246.2	32.4	-62.8	-13	49.8
	492.4	30.0	-65.2	-13	52.2
	861.7	39.1	-56.1	-13	43.1
	984.8	42.1	-53.1	-13	40.1
121.5 / 123.1	All other	< -40	-55.2	-13	42.2

All harmonic are checked with RBW of 100 kHz and Peak Detector. Harmonics from 1 to 1.25 GHz are measured with 1 MHz RBW and Peak Detector.

The measurement was performed at 3m with transducer factor programmed in the spectrum analyzer. All other harmonics were lower than the ones reported above.

EUT was transmitting continuously and modulated with a 2.5 kHz signal at maximum modulation index.

Field Strength values above are converted to dBm values using the method in KDB 412172.

#### **Requirements:**

**§2.1053** (a) Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of §2.1049, as appropriate. For equipment operating on frequencies below 890 MHz, an open field test is normally required, with the measuring instrument antenna located in the far-field at all test frequencies. In the event it is either impractical or impossible to make open field measurements (e.g. a broadcast transmitter installed in a building) measurements will be accepted of the equipment as installed. Such measurements must be accompanied by a description of the site where the measurements were made showing the location of any possible source of reflections which might distort the field strength measurements. Information submitted shall include the relative radiated power of each spurious emission with reference to the rated power output of the transmitter, assuming all emissions are radiated from halfwave dipole antennas.

(b) The measurements specified in paragraph (a) of this section shall be made for the following equipment:

(2) All equipment operating on frequencies higher than 25 MHz.

**§2.1057** (a) In all of the measurements set forth in §§2.1051 and 2.1053, the spectrum shall be investigated from the lowest radio frequency signal generated in the equipment, without going below 9 kHz, up to at least the frequency shown below:

(1) If the equipment operates below 10 GHz: to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

(b) Particular attention should be paid to harmonics and subharmonics of the carrier frequency as well as to those frequencies removed from the carrier by multiples of the oscillator frequency. Radiation at the frequencies of multiplier stages should also be checked.

(c) The amplitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be reported. **§80.211** The emissions must be attenuated according to the following schedule.

(f) The mean power when using emissions other than those in paragraphs (a), (b), (c) and (d) of this section:

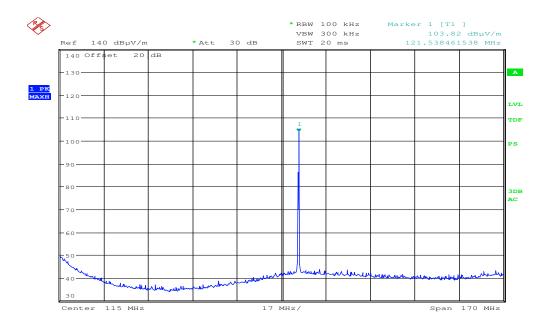

(1) On any frequency removed from the assigned frequency by more than 50 percent up to and including 100 percent of the authorized bandwidth: At least 25 dB;

(2) On any frequency removed from the assigned frequency by more than 100 percent up to and including 250 percent of the authorized bandwidth: At least 35 dB; and

(3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least 43 plus 10log₁₀ (mean power in watts) dB.

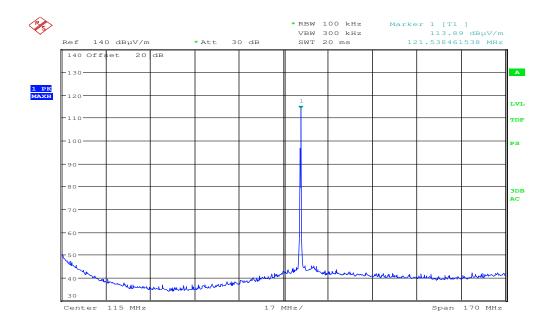

Frequency Range	Limit, §80.211(f)
More than 4 kHz and less than 8 kHz from Nominal Frequency	At least 25 dB below carrier
More than 8 kHz and less than 20 kHz from Nominal Frequency	At least 35 dB below carrier
More than 20 kHz from Nominal Frequency	At least (43 + 10 log ₁₀ (Mean Power in Watts)) dB below carrier

#### Limit:

**§2.1055** (a) The frequency stability shall be measured with variation of ambient temperature as follows:

(2) From -20° to + 50° centigrade for equipment to be licensed for use in the Maritime Services under part 80 of this chapter.

(b) Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10° centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement. The short term transient effects on the frequency of the transmitter due to keying (except for broadcast transmitters) and any heating element cycling normally occurring at each ambient temperature level also shall be shown. Only the portion or portions of the transmitter containing the frequency determining and stabilizing circuitry need be subjected to the temperature variation test.

(d) The frequency stability shall be measured with variation of primary supply voltage as follows:

(2) For hand carried, battery powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.

(3) The supply voltage shall be measured at the input to the cable normally provided with the equipment, or at the power supply terminals if cables are not normally provided. Effects on frequency of transmitter keying (except for broadcast transmitters) and any heating element cycling at the nominal supply voltage and at each extreme also shall be shown.

§80.209 (a) The frequency tolerance requirements applicable to transmitters in the maritime services are shown in the following table.

Frequency bands and categories of stations	Tolerances	
(iii) Survival craft stations operating on 121.500 MHz	50 ppm	

# 4 LIST OF TEST EQUIPMENT

To facilitate inclusion on each page of the test equipment used for related tests, each item of test equipment and ancillaries are identified (numbered) by the Test Laboratory.

# 5 BLOCK DIAGRAM

# 5.1 Conducted Tests

This test set-up is used for all Conducted tests. A 20dB attenuator was used for all conduicted tests.

# 5.2 Test Site Radiated Emission

This test setup is used for all radiated emissions tests. Measuring distance is 3m for all frequencies up to 18 GHz.

Emissions above 1 GHz are measured with a Spectrum Analyzer and Horn Antenna.

All measurements at 1 GHz and above were performed with turntable height 1.5m and with the ground plane covered by absorbers.

A pre-amplifier is used for all measurements and High-Pass filter is used for all harmonics.
