5.6 15. 247(a)(1) Number of Channels and Time of Occupancy

5.6.1 Setting Remarks

- EUT directly connects to the spectrum analyzer via calibrated coaxial cable and a suitable attenuator.
- The Number of Channels is determined by using Max-hold of the spectrum shape of spectrum analyzer.
- Time of Occupancy is determined by using the marker-data function of spectrum analyzer.
- The spectrum analyzer is set-up as following to measure Number of Channels;

☒ Frequency Span	: 79 MHz
☒ Resolution bandwidth	: 1 MHz
☒ Video bandwidth	: 3 MHz
☒ Sweep Time	: Auto
☒ Detector function	: Peak
☒ Trace Mode	: Max Hold

- The spectrum analyzer is set-up as following to measure Time of Occupancy;

☒ Frequency Span	: 0 Hz
☒ Resolution bandwidth	: 30 kHz
☒ Video bandwidth	: 30 kHz
☒ Detector function	: Peak
☒ Trace Mode	: Max Hold

- See test configuration figure 4.3.

5.6.2 Minimum Standard

This frequency hopping system must employ minimum of 15 hopping channels.

The maximum permissible time of occupancy is 400 ms within the minimum time period required to hop through all channels.

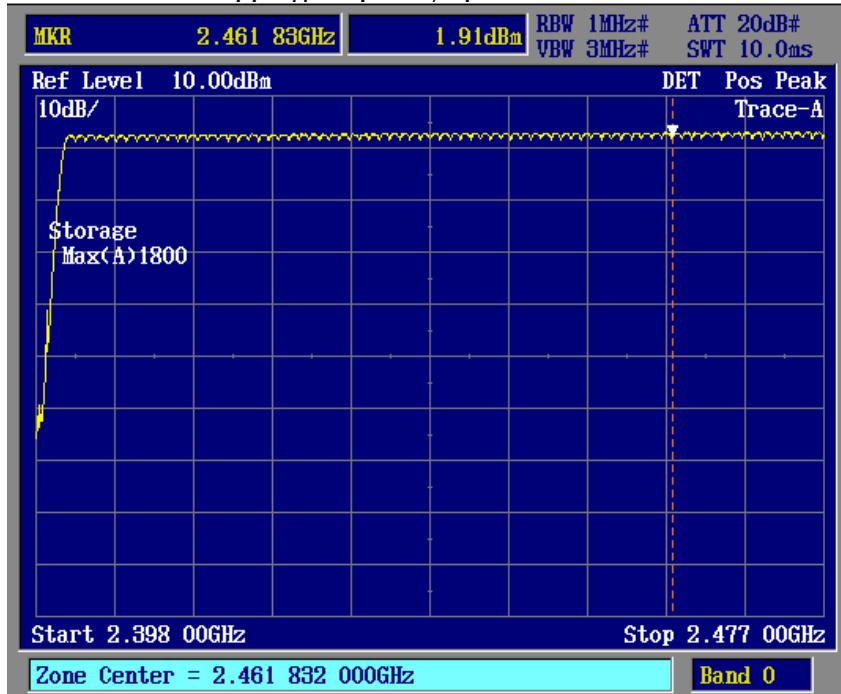

5.6.3 Result

EUT complies with the requirement.

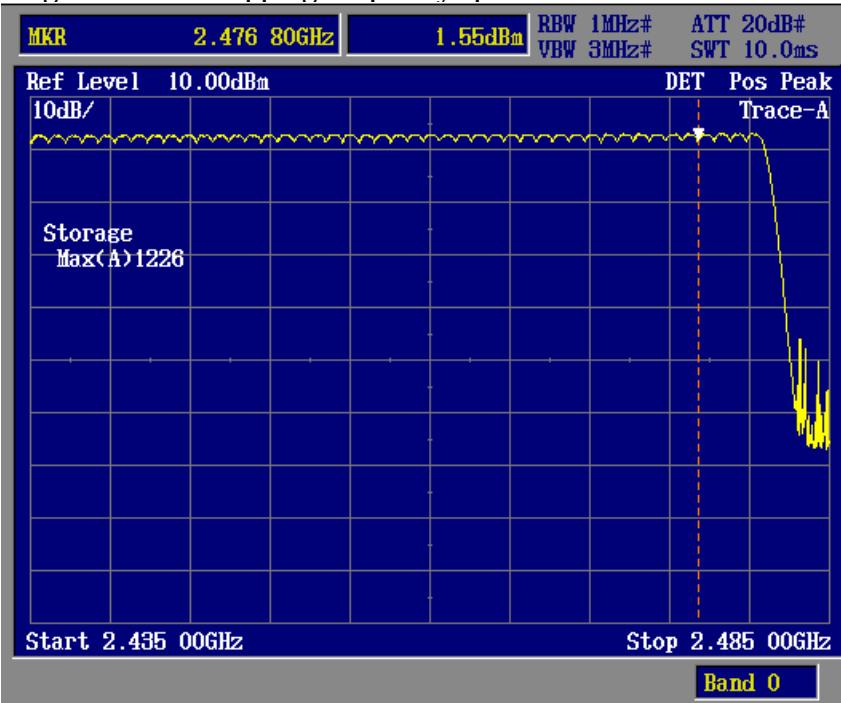

Uncertainty of measurement result: 1 usec
Temperature, Humidity : 23°C, 40%

5.6.4 Measured Data

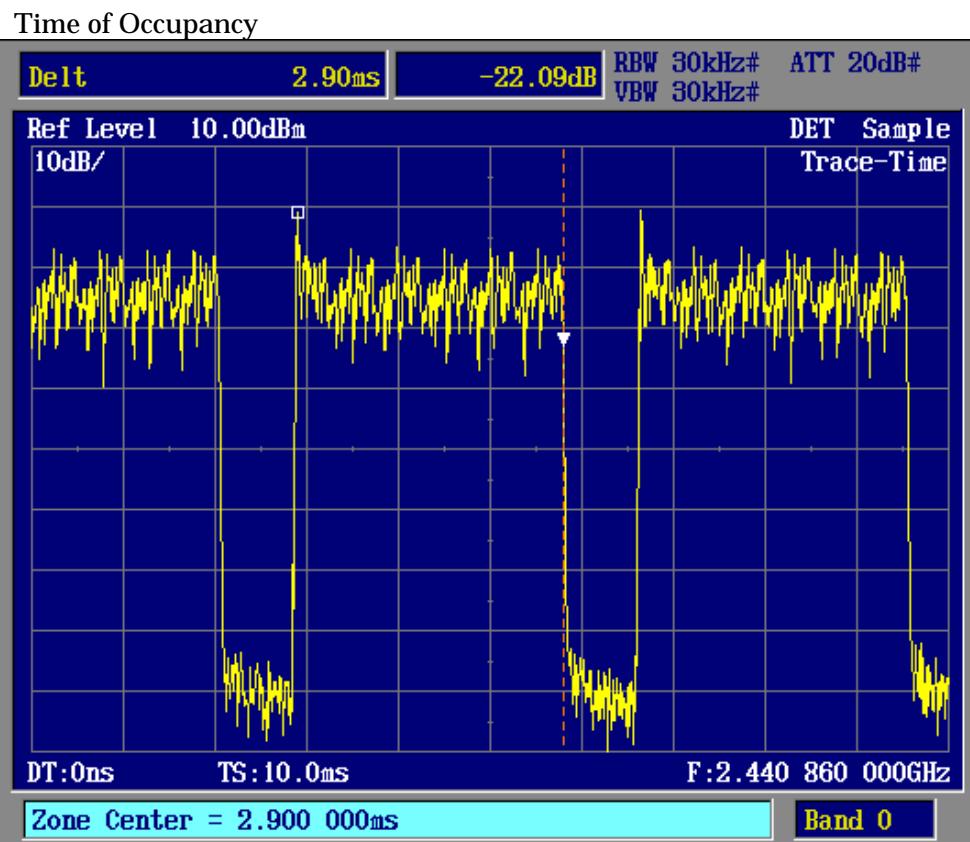

Lower band of hopping frequency spectrum

Higher band of hopping frequency spectrum

Number of observed channels	79
-----------------------------	----

The dwell time within a 31.6sec period in data mode is 1 inside the packet type.

Channel Hopping Rate: 1600 hops / sec

Number of channels: 79

Time slot length: 2.9 msec

The calculation for a 31.6sec period is as follows;

Dwell time = time slot length x hoprate / number of channels x period time

Time of occupancy (dwell time) is as follows;

(DH5 Time slot Dwell time) = 2.9msec x (1600/(6x79)) x 31.6sec = 0.309sec

5.7 15. 247(c) Band Edge Measurement

5.7.1 Setting Remarks

- EUT directly connects to the spectrum analyzer via calibrated coaxial cable and 10 dB attenuator.
- The emission at the band edge is measured by using the marker function of spectrum analyzer.
- The peak of the in-band emission is measured by using the marker to peak function of spectrum analyzer.
- This measurement is repeated in both side of the spectrum.
- The spectrum analyzer is set-up as following;

Resolution bandwidth	: Equal or less than 1% of frequency span
Video bandwidth	: > RBW
Sweep	: Auto
Detector function	: Peak
Trace Mode	: Max Hold

- Where bandedge spectrum is too rough to find precise edge point, larger RBW i.e. 1MHz, 3MHz shall be applied as severer condition.
- See test configuration figure 4.3.

5.7.2 Minimum Standard

In any 100kHz bandwidth outside the frequency band in which the transmitter is operating, emissions shall be at least 20 dB below the fundamental emission or shall not exceed the following field strength limits. Emissions falling in the restricted bands of 15.205 shall not exceed the following field strength limits:

Frequency of Emission (MHz)	Limit of the band edge spurious emission (dB μ V)	
	Peak	Average
Below 2,390.0		
Above 2,483.5	74	54

5.7.3 Result

EUT complies with the requirement.

Uncertainty of measurement result: ± 2.6 dB

Temperature, Humidity : 23°C, 40%

5.7.4 Measured Data

The band edge emissions are calculated as following;

(Angle 1)

Lower frequency 2,390 MHz (FH) Vertical

	Level (dBuV/m)
P _{max}	77.38
