### 3.1.3 Description of the test

In this report we tested only the radiated emissions of the sample. Conducted measurements were not applicable.

### 3.1.4 Extreme conditions testing values

Description	Shortcut	Unit	Value
Nominal Temperature	T <sub>nom</sub>	°C	<b>23</b>
Nominal Humidity	H <sub>nom</sub>	%	<b>63</b>
Nominal Power Source	V <sub>nom</sub>	V	<b>3.0</b>

Type of power source: **DC supplied by battery (2 x Type AA)**

Deviations from these values are reported in chapter 2

## 4 Statement of Compliance

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

## 5 Measurements and results

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 1 GHz in semi-anechoic chambers or free field. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber.

**The receiving antennas are conform with specifications ANSI C63.2-1996 clause 15 and ANSI C63.4-2003 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test set-ups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received.**

The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.4-2003 clause 4.2.

Antennas are conform with ANSI C63.2-1996 item 15.

150 kHz - 30 MHz: Quasi Peak measurement, 9 kHz Bandwidth, passive loop antenna.

30 MHz - 200 MHz: Quasi Peak measurement, 120 kHz Bandwidth, biconical antenna

200MHz - 1GHz: Quasi Peak measurement, 120 kHz Bandwidth, log periodic antenna

>1GHz: Average, RBW 1 MHz, VBW 10 Hz, wave guide horn

All measurement settings are according to FCC 15.209 and 15.207

## 5.1 Part 15 Subpart C

### 5.1.1 Timing of the transmitter

#### **Not applicable**

#### **Reference**

FCC:	CFR Part SUBCLAUSE § 15.35 (c)
IC:	RSS 210, Issue 7 6.5 PULSED OPERATION

#### **Limits: § 15.35 (c)**

(c) Unless otherwise specified, e.g. Section 15.255(b), when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted with any application for certification or shall be retained in the measurement data file for equipment subject to notification or verification.

	158489 $\mu$ V/m ( 104 dB $\mu$ V/m)	10
		Recalculated acc. to FCC part15.31 (f2)

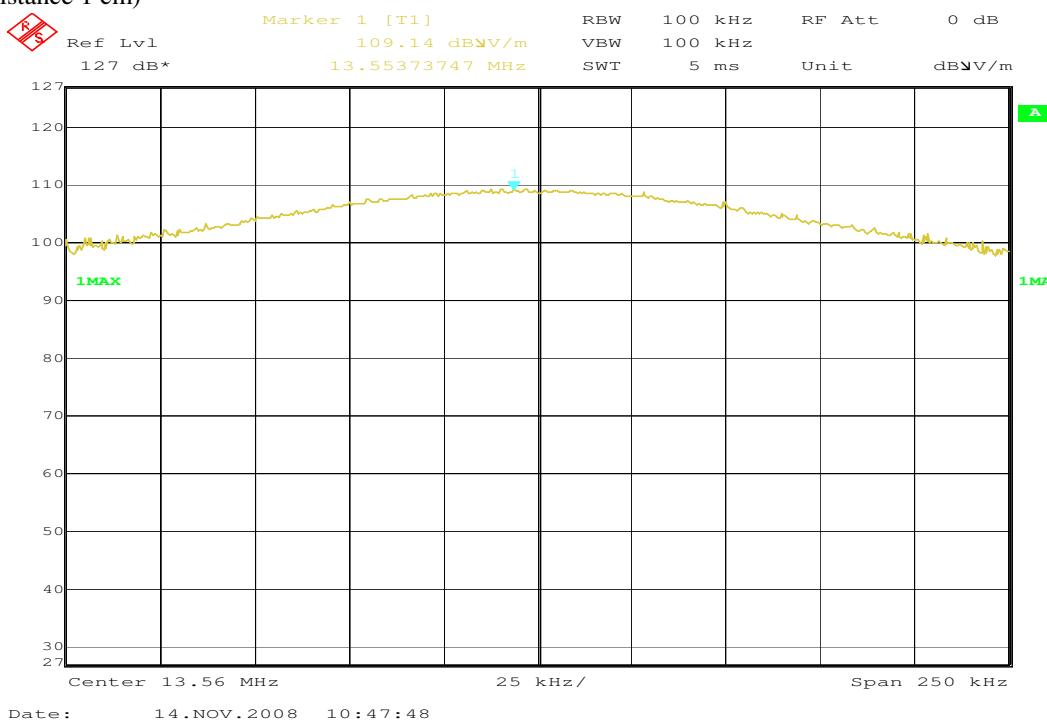

Due to the small power level of the transmitter signal the measurement was performed with a measurement distance of 1 cm (see Photo 1). The measurement distance consists on the physical dimensions of the test cassette and the housing of the unit. The measured field strength (Plot 1) was recalculated with a correction factor of 40dB/decade. This correction factor was selected as minimum field attenuation value to show compliance.

The correction factor from 1cm to 10m is 120dB.

#### Spectrum mask part15.225 (a,b,c,d)

Due to the very low output power the measurements were performed with a measurement distance of 1cm. Even with this small distance it was not possible to show the limits of the spectrum mask on the same plot. So we choose these two plots to show compliance.

Result: PASS

The transmitter fulfills the requirements of FCC 15.225 (a,b,c and d)

## 6 Test equipment and ancillaries used for tests

To simplify the identification on each page of the test equipment used, on each page of the test report, each item of test equipment and ancillaries such as cables are identified (numbered) by the Test Laboratory, below.

All reported calibration intervals are calibrations according to the EN/ISO/IEC 17025 standard. These calibrations were performed from an accredited external calibration laboratory.

Additional to these calibrations the laboratory performed comparison measurements with other calibrated systems and performed a weekly chamber inspection.

All used devices are connected with a 10 MHz external reference.

According to the manufacturers' instruction is it possible to establish a calibration interval for the FSP unit of 24 month, if the device has an external 10 MHz reference.
