

The code is a signal of MCU by the address, DATA code, synchronous code form a complete serial DATA, press function keys is out of the pins serial DATA output pulse (LED LCD or as the function of the button with instructions, when output pulse in a high level by the 25 th Y1, during the composition such as the high frequency, C9 launch circuit initial launch and amplitude carrier high frequency signals, is out for a bit when feet during launch circuit, and the high frequency oscillation, so stop high frequency launch circuit controlled by MCU is completely out of the digital signal output feet, and the high frequency launch circuit complete range keying (like to) modulation
