Page : 1 of 88
Issued date : October 9, 2014
Revised date : December 12, 2014 (-r04)
FCC ID : W2Z-01000006

SAR TEST REPORT

Test Report No.: 10318894S-C

Applicant : FUJIFILM Corporation
Type of Equipment : Flat Panel Sensor
Model No. : DR-ID1201SE (* With built-in wireless LAN module)
FCC ID : W2Z-01000006
Test Standard : FCC 47CFR §2.1093
Test Result : Complied

Highest Reported SAR(1g) Value	Operation Band	Remarks
< 0.10 W/kg	2412-2472MHz	(DTS) Antenna#0, 2417MHz, 11n(20HT)(MCS0), Output power: 15.00dBm, Measured SAR(1g)=0.022W/kg.
0.17 W/kg	5180-5320MHz	(UNII) Antenna#0, 5260MHz, 11a (6Mbps), Output power: 13.29dBm, Measured SAR(1g)=0.113W/kg.
0.20 W/kg	5500-5700MHz	(UNII) Antenna#0, 5680MHz, 11a (6Mbps), Output power: 16.01dBm, Measured SAR(1g)=0.14W/kg.
0.20 W/kg	5745-5825MHz	(UNII) Antenna#0, 5745MHz, 11a (6Mbps), Output power: 16.18dBm, Measured SAR(1g)=0.134W/kg.

*. The highest reported SAR (1g) value across all exposure condition is "0.20 W/kg" = grant listing.

*. Co-location was not considered, because the SLSSR (SAR to peak location separation ratio) was smaller than 0.04.

1. This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc.
2. The results in this report apply only to the sample tested.
3. This sample tested is in compliance with the limits of the above regulation.
4. The test results in this test report are traceable to the national or international standards.
5. This test report must not be used by the customer to claim product certification, approval, or endorsement by any agency of the Federal Government.
6. The opinions and the interpretations to the result of the description in this report are outside scopes where UL Japan has been accredited.

Date of test: September 8-12 and 16, 2014

Test engineer:

Hiroshi Naka
Engineer, Consumer Technology Division

Approved by:

Toyokazu Imamura
Leader, Consumer Technology Division

- The testing in which "Non-accreditation" is displayed is outside the accreditation scopes in UL Japan.
 There is no testing item of "Non-accreditation".

REVISION HISTORY

Revision	Test report No.	Date	Page revised	Contents
Original	10318894S-C	October 9, 2014	-	-
-r01	10318894S-C	December 2, 2014	p1,2,6,	w58 band: DTS->UNII.
-r02	10318894S-C	December 10, 2014	p1,2,3, p6,16,17	Operation temperature range is deleted. Correction of erroneous description.
-r03	10318894S-C	December 12, 2014	P6,16	Operation temperature range is deleted. Correction of erroneous description.
-r04	10318894S-C	December 12, 2014	P17	Operation temperature range is deleted. Correction of erroneous description.

*. By issue of new revision report, the report of an old revision becomes invalid.

Appendix 3-8 Calibration certificate: E-Field Probe (EX3DV4)	50
Appendix 3-9 Calibration certificate: Dipole (D2450V2).....	61
Appendix 3-10 Calibration certificate: Dipole (D5GHzV2)	69

SECTION 1: Customer information

Company Name	FUJIFILM Corporation
Brand Name	FUJIFILM
Address	2-26-30 Nishiazabu Minatoku Tokyo 106-8620, Japan
Telephone Number	81-3-6271-1975
Facsimile Number	81-3-6271-1189
Contact Person	Mitsuyuki Komiya

SECTION 2: Equipment under test (EUT)

2.1 Identification of EUT

Type of Equipment	Flat Panel Sensor
Model Number	DR-ID1201SE
Serial Number	N120002
Condition of EUT	Engineering prototype (*. Not for sale. This sample is equivalent to mass-production items)
Receipt Date of Sample	August 4, 2014 (*. No modification by the Lab.)
Country of Mass-production	Japan
Rating	DC8V
Category Identified	Portable device (*. Since EUT may contact and/or very close to a human body and head during Wi-Fi operation, the partial-body SAR (1g) shall be observed.)
SAR Accessory	Any body-worn accessory was not applied.
Feature of EUT, SAR tested consideration	<p>Model: DR-ID1201SE (referred to as the EUT in this report) is a Flat Panel Sensor with a wireless function and used in the hospitality environment. Since this EUT is the medical device, the EUT is only used under the guidance of a doctor or a qualified person. The possibility of the maximum RF human exposure is only a body/head of the patient who comes in contact directly on the front surface side (patient side) of the EUT.</p> <p>Therefore, the SAR test was only applied to the front surface side (patient side) of the EUT.</p>

- *. DR-ID1201SE: Flat Panel Sensor has the series model: DR-ID1211SE.
DR-ID1211SE is the same mechanically and electrically as DR-ID1201SE, except X ray detection component. This difference doesn't influence the characteristic of wireless LAN applications. Therefore, DR-ID1201SE was tested representatively.

	DR-ID1201SE	DE-ID1211SE
Size of panel (mm)	393.8×459.8×16.0	393.8×459.8×16.0
X ray detection component (scintillator)	GOS (Gd ₂ O ₃ :Tb, oxysulfide gadolinium)	CsI (cesium iodide)

2.2 Product Description (Wireless LAN module, antenna)

Equipment type	Transceiver			
Model	SX-PCEAN(FF-E)			
Frequency band	2.4GHz band		5GHz band	
Frequency of operation (MHz) (*.ch.: channel)	11b,g, n(20HT) 2412-2462 (*.ch.1-11) n(40HT) 2422-2452 (*.ch.3-9)		11a, n(20HT) 5180-5320 (*.ch.36-64) n(40HT) 5190-5310 (*.ch.38-62)	5500-5700 (*.ch.100-140) 5510-5670 (*.ch.102-134)
Channel spacing (MHz)	5 (11b,g,n(20HT),n(40HT))			
Bandwidth (MHz)	20 (11b,g,n(20HT))/40 (11n(40HT))			
Type of modulation	DSSS: DBPSK, DQPSK, CCK (11b), OFDM: BPSK, QPSK, 16QAM, 64QAM (11g,a,n(20HT),n(40HT))			
Transmit power (typical, maximum channel and data rate) and tolerance (as manufacture variation) (dBm) (*.ch.: channel)	11b 11g n(20HT) n(40HT)	13.5±2.5 17.0±2.5 14.5±2.5 13.5±2.5	11a: n(20HT) n(40HT)	12.5±2.5 (*.ch.36-64, 6-54Mbps) 11.0±2.5 (*.ch.36-64, MCS0-6/8-14) 11.0±2.5 (*.ch.46-54, MCS0-7/8-15)
				15.0±2.5 (*.ch.100-140, 6-48Mbps) 13.5±2.5 (*.ch.100-140, MCS0-4/8-12) 11.0±2.5 (*.ch.102-134, MCS0-5/8-13)
				15.0±2.5 (*.ch.149-165, 6-48Mbps) 13.5±2.5 (*.ch.149-165, MCS0-4/8-12) 11.0±2.5 (*.ch.151-159, MCS0-5/8-13)
	*. The value in a table shows the maximum power conditions of typical on each antenna. *. 3dBm is added to MIMO power. *. Refer to clause 2.3 for more detail. Refer to clause 2.4 for the maximum output power which may possible. *. The measured Tx output power (conducted) refers to section 6 in this report.			
Power supply	DC 3.3V (*. DC3.3V is supplied from the main unit via constant voltage circuit.)			

**UL Japan, Inc.
Shonan EMC Lab.**

Telephone: +81 463 50 6400 / Facsimile: +81 463 50 6401

Antenna	antenna #1 (Bottom, short edge side)	antenna #0 (Side, long edge side)
Antenna quantity	2 pcs. (* Separation distance between the antenna 1 and the antenna: 417mm) 11b,g,a: One selected Tx antenna operation. 11n(20HT),n(40HT): One selected Tx antenna operation (MCS0~7) / Two Tx antenna operation (MCS8~13)	
Antenna model	113Y120035A (cable length: 300mm)	113Y1200036A (cable length: 575mm)
Antenna type / connector type	Monopole antenna / Connector; PCB side: U.FL, Antenna side: soldered	
Antenna gain (max.peak) (*excluding cable loss)	-5.1 dBi (2.4GHz), -1.3 dBi (5GHz)	-6.9 dBi (2.4GHz) -1.8 dBi (5GHz)

*. The EUT do not use the special transmitting technique such as "beam-forming" and "time-space code diversity."

2.3 Tx output power (typical) specification (antenna port terminal conducted)

SECTION 3: Test specification, procedures and results

3.1 Test specification

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. The device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling in accordance with the following measurement procedures..

KDB 447498 D01 (v05r02): General RF exposure guidance

KDB 248227 D01 (v01r02): SAR Measurement Procedures for 802.11a/b/g Transmitters

KDB 865664 D01 (v01r03): SAR measurement 100MHz to 6GHz

IEEE Std. 1528-2003: IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques

IEEE Std. 1528-2013: IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.

(* The reference for Uncertainty in SAR correction for deviations in permittivity and conductivity, in clause E.3.2.)

3.2 Exposure limit

Environments of exposure limit	Whole-Body (averaged over the entire body)	Partial-Body (averaged over any 1g of tissue)	Hands, Wrists, Feet and Ankles (averaged over any 10g of tissue)
(A) Limits for Occupational /Controlled Exposure (W/kg)	0.4	8.0	20.0
(B) Limits for General population /Uncontrolled Exposure (W/kg)	0.08	1.6	4.0

*. Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

*. General Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

The limit applied in this test report is;

General population / uncontrolled exposure, Partial-Body (averaged over any 1g of tissue) limit: 1.6 W/kg

3.5 Confirmation before SAR testing

3.5.1 Average power for SAR test

Before SAR test, the RF wiring for the sample had been switched to the antenna conducted power measurement line from the antenna line and the average power was measured. The result is shown in Section 6.

Step.1 Data rate check

The data rate check was measurement on one of the channel for 802.11b,g,a,n(20HT) and n(40HT) at each frequency band.

11b		11g		11a		11n(20HT)						11n(40HT)					
Mod (DSSS)	Data rate	Mod (OFDM)	Data rate	Mod (OFDM)	Data rate	MCS Index	Spatial Stream	Mod (OFDM)	MCS Index	Spatial Stream	Mod (OFDM)	MCS Index	Spatial Stream	Mod (OFDM)	MCS Index	Spatial Stream	Mod (OFDM)

* Mod; Modulation		16QAM	24 Mbps	16QAM	24 Mbps	MCS4	1	16QAM	MCS12	2	16QAM	MCS4	1	16QAM	MCS12	2	16QAM
16QAM		36 Mbps	16QAM	36 Mbps	MCS5	1	64QAM	MCS13	2	64QAM	MCS5	1	64QAM	MCS13	2	64QAM	
64QAM		48 Mbps	64QAM	48 Mbps	MCS6	1	64QAM	MCS14	2	64QAM	MCS6	1	64QAM	MCS14	2	64QAM	
64QAM		54 Mbps	64QAM	54 Mbps	MCS7	1	64QAM	MCS15	2	64QAM	MCS7	1	64QAM	MCS15	2	64QAM	

*. The average power related with the data rate was measured on one of the channel for 802.11b/g/a/n(20HT)/n(40HT) modes.

Step.2 Decision of SAR test channel

The following operation mode, data rate and channels were determined by the SAR reference power measured. (Refer to Section 6.)

(default: KDB248227->)			SAR tested channel (1Tx)				SAR tested channel (2Tx)				Remarks (KDB248227)		
Mode	MHz	Channel	b/g/n(20HT)	b	g	n(20HT)	n(40HT)	n(20HT)	n(40HT)	n(20HT)	n(40HT)		
11 b/g/n	2412	1	✓	#(ant#0#1)	n/a(*1)	n/a(*1)	-	n/a(*4)	-	-	-	*1. Since the extrapolated maximum peak SAR for the maximum output channel was ≤1.6W/kg and the 1g averaged SAR was ≤0.8W/kg, the testing for other channels were omitted.	
	2417	2	*	#(ant#0#1)	#(ant#0#1)	#(ant#0#1)	(2427MHz) #(ant#0#1)	n/a(*4)	(2422MHz) n/a(*4)	n/a(*4)	n/a(*4)		
	2437	6	✓	n/a(*1)	n/a(*1)	n/a(*1)	n/a(*1)	n/a(*4)	n/a(*4)	n/a(*4)	n/a(*4)		
	2462	11	✓	n/a(*1)	n/a(*1)	n/a(*1)	(2452MHz) n/a(*1)	n/a(*4)	(2452MHz) n/a(*4)	n/a(*4)	n/a(*4)		
11 a/n	5180	36	✓	-	n/a(*1)	n/a(*3)	(5190MHz) n/a(*1)	n/a(*4)	(5190MHz) n/a(*4)	n/a(*4)	(5190MHz) n/a(*4)	*2. Since the typical average power of n(40HT) was smaller than the corresponded 11a mode power and measured SAR(1g) of 11a mode was very small, SAR test of n(40HT) was only considered for the worst SAR antenna of 11a mode with highest power channel.

✓ = "default test channels of requested by KDB248227", n/a = SAR test was not applied, # = SAR test was applied (max. power channel).

* = Possible 802.11a channels with maximum average output > the "default test channels"

3.6 Confirmation after SAR testing

It was checked that the power drift [W] is within ±5% in the evaluation procedure of SAR testing. The verification of power drift during the SAR test is that DASY5 system calculates the power drift by measuring the e-filed at the same location at beginning and the end of the scan measurement for each test position.

The result is shown in APPENDIX 2.

*. DASY5 system calculation Power drift value[dB] = 20log(Ea)/(Eb) (where, Before SAR testing: Eb[V/m] / After SAR testing: Ea[V/m])

Limit of power drift[W] = ±5%

Power drift limit (X) [dB] = 10log(P_drift)=10log(1.05/1)=10log(1.05)-10log(1)=0.21dB

from E-filed relations with power.

$S=E \times H = E^2 / \eta = P / (4 \times \pi \times r^2)$ (η : Space impedance) → $P=(E^2 \times 4 \times \pi \times r^2) / \eta$

Therefore, The correlation of power and the E-filed

Power drift limit (X) dB=10log(P_drift)=10log(E_drift)^2=20log(E_drift)

From the above mentioned, the calculated power drift of DASY5 system must be the less than ±0.21dB.

3.7 Test setup of EUT and SAR measurement procedure

After considering the outline of EUT, the SAR test was carried out on the following setup conditions.

Setup	Explanation of EUT setup position (* Refer to Appendix 1 for test setup photographs.)	antenna #0		antenna #1	
		Antenna distance	SAR Tested /Reduced	Antenna distance	SAR Tested /Reduced
Front	The front surface (patient side) of EUT was touched to the Flat phantom.	10mm	Tested (*2)	10mm	Tested (*2)
Back-tilt (antenna#0)	The EUT was set tilt and the back surface (operator side) which was near antenna#0 was touched to the Flat phantom.	1.6mm	Reduced (*1)		
Back-tilt (antenna#1)	The EUT was set tilt and the back surface (operator side) which was near antenna#1 was touched to the Flat phantom.			1.6mm	Reduced (*1)
Back-flat	The middle of back surface (operator side) of EUT was touched to the Flat phantom.	4mm	Reduced (*1)	4mm	Reduced (*1)
Long side (antenna#0)	The long side edge surface (near antenna #0 side) of EUT was touched to the Flat phantom.	11mm	Reduced (*1)	289mm	Reduced (*1)
Long side	The long side edge surface (opposite to antenna#0) of EUT was touched to the Flat phantom.	370mm	Reduced (*1)	62mm	Reduced (*1)
Short side (antenna#1)	The short side edge surface (near antenna #1 side) of EUT was touched to the Flat phantom.	343mm	Reduced (*1)	11mm	Reduced (*1)
Short side	The short side edge surface (opposite to antenna#1) of EUT was touched to the Flat phantom.	84mm	Reduced (*1)	445m	Reduced (*1)

*. Antenna distance: this means the distance from the antenna inside a EUT to the outer surface of EUT form which an operator may touch.

*. Size of EUT: 383.5 × 459.8 × 15 (thickness) [mm]

***1. Since this EUT is the medical device, the EUT is only used under the guidance of a doctor or a qualified person. The possibility of the maximum RF human exposure is only a body/head of the patient who comes in contact directly on the front surface side (patient side) of the EUT. Therefore, the SAR test was only applied to the front surface side (patient side) of the EUT.**

***2. SAR test reduction consideration**

KDB 447498 D01 (v05) was taken into consideration as other approaches to reduce SAR test.

<Standalone SAR estimation>

Mode	Band	Position	Minimum distance	Upper frequency	Max. power (with tune-up tolerance)	Estimate SAR(1g) (standalone)	Remarks
11g	2.4GHz	Front (Patient side)	10mm	2.462 GHz	19.5 dBm (89 mW)	1.86 W/kg	>0.4W/kg, SAR test is required.
11a	W52/53			5.32 GHz	15.0 dBm (32 mW)	0.98 W/kg	>0.4W/kg, SAR test is required.
11a	W56			5.7 GHz	17.5 dBm (56 mW)	1.78 W/kg	>0.4W/kg, SAR test is required.
11a	W58			5.825 GHz	17.5 dBm (56 mW)	1.80 W/kg	>0.4W/kg, SAR test is required.

Calculating formula: Estimate standalone SAR(1g) = [(max.power, mW) / (min.test separation distance, mm)] × [√f(GHz)] / [7.5]

Parenthesis 1), Clause 4.3.1, KDB 447498 D01 (v05) gives the following formula to calculate the SAR(1g) test exclusion thresholds for 100MHz-6GHz at test separation distance ≤50mm.

[max.power of channel, including tune-up tolerance, mW] / (min.test separation distance, mm)] × [√f(GHz)] ≤ 3.0 (for SAR(1g))(formula (1))
 If power is calculated from the upper formula (1);

[SAR(1g) test exclusion thresholds, mW] = 3 × [test separation distance, mm] / [√f(GHz)](formula (2))

Parenthesis 2), Clause 4.3.1, KDB 447498 D01 (v05) gives the following formula to calculate the SAR(1g) test exclusion thresholds for 1.5-6GHz at test separation distance >50mm.

[test exclusion thresholds, mW] = [Power allowed at numeric threshold for 50mm in formula (1))] + [(test separation distance, mm) - (50mm)] × 10 ·(formula (3))

According to this formula, the calculated results in typical antenna distance of platform are shown in the following table.

Upper frequency in band [GHz]	SAR(1g) test exclusion thresholds [mW]					EUT's maximum power [mW] (including tune-up tolerance)
	5	10	25	46	47	
2.462	10 (9.8dBm)	19 (12.8dBm)	-	-	90 (19.5dBm)	89 (19.5dBm)
5.32	7 (8.1dBm)	13 (11.1dBm)	33 (15.1dBm)	-	-	32 (15.0dBm)
5.7	6 (8.0dBm)	13 (11.0dBm)	-	58 (17.6dBm)	-	56 (17.5dBm)
5.825	6 (7.9dBm)	12 (10.9dBm)	-	57 (17.6dBm)	-	56 (17.5dBm)

*. The measured average power of EUT was shown in Section 6: Confirmation before SAR testing.

*** Simultaneous transmission evaluation**

Parenthesis 2) and 3), Clause 4.3.2, KDB 447498 D01 (v05) gives the following formula to calculate the simultaneous transmission SAR test exclusion limit.
 (SPLSR: SAR to peak location separation ratio must be ≤ 0.04 for antenna pair.)

Mode	Data rate	Band	Position	Minimum distance	Upper frequency	Max. power (with tune-up tolerance)	Estimate SAR(1g)			ant#0<->#1 distance	SPLSR	SAR test apply?
							Ant#0	Ant#1	Ant#0+#1			
n20	MCS8	2.4GHz	Front (Patient side)	10mm	2.462GHz	17.0dBm(50mW)	1.05 W/kg	1.05 W/kg	2.1 W/kg	417mm	0.0050	Reduced, <0.04(SPLSR)
					5.32GHz	13.5dBm(22mW)	0.68 W/kg	0.68 W/kg	1.36 W/kg	417mm	0.0033	
					5.7GHz	16.0dBm(40mW)	1.27 W/kg	1.27 W/kg	2.54 W/kg	417mm	0.0061	
					5.825GHz	16.0dBm(40mW)	1.29 W/kg	1.29 W/kg	2.58 W/kg	417mm	0.0062	

*. Calculating formula: Estimate standalone SAR(1g) = [(max.power, mW) / (min.test separation distance, mm)] × [√f(GHz)] / [7.5]

By the determined test setup shown above, the SAR test was applied in the following procedures.

Step 1	Change the operation mode on each antenna independently with highest output power channel.
Step 2	Repeat Step1 for other frequency band.

*. During SAR test, the radiated power is always monitored by Spectrum Analyzer.

SECTION 4: Operation of EUT during testing

4.1 Operation mode for SAR testing

This EUT has IEEE.802.11b,g,a,11n(20HT) and 11n(40HT) continuous transmitting modes.

The frequency and the operation mode which carried out the SAR test are shown below.

Operation mode		11b	11g	11n(20HT)		11n(40HT)		11a	11n(20HT)		11n(40HT)		
				(1xSS)	(2xSS)	(1xSS)	(2xSS)		(1xSS)	(2xSS)	(1xSS)	(2xSS)	
Tx frequency band		2412-2472MHz				2412-2462MHz				W52/53: 5180-5320MHz			
Bandwidth [MHz]		20	20	20	20	40	40	20	20	20	40	40	
SAR Tested/Reduced?		Tested	Tested	Tested	Reduced(*4)	Tested	Reduced(*4)	Tested	Reduced(*3)	Reduced(*4)	Tested	Reduced(*4)	
Tested frequency [MHz]	ant.#0	2412(*1)	2417(*1)	2417(*1)		2427(*1)		5260(*1)	-	-	5230(*1)		
	ant.#1	2412(*1)	2417(*1)	2417(*1)		2427(*1)		5300(*1)	-	-	-(*2)		
Highest power condition	Modulation	DBPSK /DSSS	BPSK /OFDM	BPSK /OFDM	-	BPSK /OFDM	-	BPSK /OFDM	-	-	BPSK /OFDM	-	
	Data rate	1Mbps	6Mbps	MCS0	-	MCS0	-	MCS0	-	-	MCS0	-	

Operation mode		11a	11n(20HT)		11n(40HT)		11a	11n(20HT)		11n(40HT)	
			(1xSS)	(2xSS)	(1xSS)	(2xSS)		(1xSS)	(2xSS)	(1xSS)	(2xSS)
Tx frequency band		W56: 5500-5700MHz		5510-5670MHz		W58: 5745-5825MHz		5755, 5795MHz			
Bandwidth [MHz]		20	20	20	40	40	20	20	20	40	40
SAR Tested/Reduced?		Tested	Reduced(*3)	Reduced(*4)	Tested	Reduced(*4)	Tested	Reduced(*3)	Reduced(*4)	Tested	Reduced(*4)
Tested frequency [MHz]	ant.#0	5680(*1)	-		5550(*1)		5805(*1)	-		5755(*1)	
	ant.#1	5680(*1)	-		(*2)		5745(*1)	-		(*2)	
Highest power condition	Modulation	BPSK /OFDM	-	-	BPSK /OFDM	-	BPSK /OFDM	-	-	BPSK /OFDM	-
	Data rate	6Mbps	-	-	MCS0	-	6Mbps	-	-	MCS0	-

Tx Controlled software: ART v09 (Build 34)

Mode: Continuous transmit mode.

Tx antenna chain: Ant#0=100, Ant#0=010, Ant#0+Ant#1(MIMO)=110.

Frequency: Selected the target frequency. / Data Rate: Selected the target data rate.

HT40: Selected when 11n(40HT) was tested.

Setting target power: The default power value was used.

*. As for parameters other than the above, the initial value was used.

*. SS: Spatial Stream

*1. (KDB248227) Since the extrapolated maximum peak SAR for the maximum output channel was $\leq 1.6\text{W/kg}$ and the 1g averaged SAR was $\leq 0.8\text{W/kg}$, the testing for other channels were omitted.

*2. Since the typical average power of n(40HT) was smaller than the corresponded 11a mode power and measured SAR(1g) of 11a mode was very small, SAR test of n(40HT) was only considered for the worst SAR antenna of 11a mode with highest power channel.

*3. (KDB248227) Since the average power of n(20HT) was smaller than the corresponded 11a power, SAR test was not applied to n(20HT) mode.

*4. (KDB447498) Since SPLSR (SAR to peak location separation ratio) was enough smaller than 0.04, SAR test of MIMO mode was reduced.

*. [Yellow] SAR test was applied.

- *1. (KDB248227) Since the extrapolated maximum peak SAR for the maximum output channel was $\leq 1.6\text{W/kg}$ and the 1g averaged SAR was $\leq 0.8\text{W/kg}$, the testing for other channels were omitted. (*. By Clause 4.3.3 of KDB447498 D01, 1g averaged SAR (reported) was $\leq 0.6\text{W/kg}$, when the Tx band is 100~200MHz.)
- *2. (KDB248227) Since the average power of 11n(20HT)(SISO) and 11n(40HT)(SISO) were more than 1dB lower than the corresponded 11a power and measured SAR(1g) of 11a mode was very small, SAR test was reduced for 11n(20HT)(SISO) mode and SAR test of n(40HT) was only considered for the worst SAR antenna of 11a mode with highest power channel.

- *3. (KDB447498) Since SPLSR (SAR to peak location separation ratio) was enough smaller than 0.04, SAR test of MIMO mode was reduced.

- *. Freq: Frequency, Typ.: Typical, Max.: Maximum, Power spec.: Power specification, Set pwr: Setting power for the measurement, Ave.: Average
- *. Calculating formula: $\Delta_{\text{target}}(\text{dB}) = (\text{measured power, dBm}) - (\text{Typ.target power, dBm})$; $\Delta_{\text{Max.}}(\text{dB}) = (\text{measured power, dBm}) - (\text{Max. specification power, dBm})$
 Results (Ave, dBm) = (P/M Reading, dBm) + (Cable loss, dBm) + (Attenuator, dBm) + (duty factor, dBm), where (duty factor, dBm) = $10 \times \log(100/\text{duty cycle, \%})$
- *. Date measured May 7, 8, 9 and 20, 2014 / measured by: T. Arai, H. Shirasawa, S. Takano, H. Naka (23~27deg.C/37~50%RH, at M/R#1 and Pre-S/R#7)
- *. Uncertainty of antenna port conducted test; Power measurement uncertainty above 1GHz for this test was: (\pm) 1.5dB

*: SAR test was applied.

(for table of 6.1.3: 5500-5700MHz)

*1. (KDB248227) Since the extrapolated maximum peak SAR for the maximum output channel was $\leq 1.6\text{W/kg}$ and the 1g averaged SAR was $\leq 0.8\text{W/kg}$, the testing for other channels were omitted. (By Clause 4.3.3 of KDB447498 D01, 1g averaged SAR (reported) was $\leq 0.4\text{W/kg}$, when the Tx band is $\geq 200\text{MHz}$.)

*2. (KDB248227) Since the average power of 11n(20HT)(SISO)(typical=13.5dBm) and 11n(40HT)(SISO)(typical=11.0dBm) were enough lower than the corresponded 11a power(typical=15.0dBm) and measured SAR(1g) of 11a mode was very small, SAR test was reduced for 11n(20HT)(SISO) mode and SAR test of n(40HT) was only considered for the worst SAR antenna of 11a mode with highest power channel.

*3. (KDB447498) Since SPLSR (SAR to peak location separation ratio) was enough smaller than 0.04, SAR test of MIMO mode was reduced.

*. Freq.: Frequency, Typ.: Typical, Max.: Maximum, Power spec.: Power specification, Set pwr: Setting power for the measurement, Ave.: Average

*. Calculating formula: $\Delta\text{target(dB)} = (\text{measured power, dBm}) - (\text{Typ.target power, dBm})$; $\Delta\text{Max.(dB)} = (\text{measured power, dBm}) - (\text{Max. specification power, dBm})$

Results (Ave, dBm) = $(\text{P/M Reading, dBm}) + (\text{Cable loss, dBm}) + (\text{Attenuator, dBm}) + (\text{duty factor, dBm})$, where (duty factor, dBm)= $10 \times \log(100/(\text{duty cycle, \%}))$

*. Date measured May 7, 8, 9 and 20, 2014 / measured by: T. Arai, H. Shirasawa, S. Takano, H. Naka (23~27degC/37~50%RH, at M/R#1 and Pre-S/R#7)

*. Uncertainty of antenna port conducted test; Power measurement uncertainty above 1GHz for this test was: (\pm) 1.5dB

6.1.4 5745-5825MHz: W58 band

*. Since this EUT is the medical device, the EUT is only used under the guidance of a doctor or a qualified person. The possibility of the maximum RF human exposure is only a body/head of the patient who comes in contact directly on the front surface side (patient side) of the EUT. Therefore, the SAR test was only applied to the front surface side (patient side) of the EUT.

Notes: *1. At the highest output power channel, since the extrapolated maximum peak SAR for the maximum output channel was ≤ 1.6 W/kg and the 1g averaged SAR was ≤ 0.8 W/kg, the testing for other channels were omitted. (KDB248227)

*. Gap: It is the separation distance between the nearest position of platform outer surface and the bottom outer surface of phantom; n/a: not applied.

*. Battery No. #2 and #3 were same model. Refer to Appendix 1 for more details.

*. During test, the EUT was operated without all signal interface cables (except LAN cable for the Tx control) and with a full-charged battery.

*. Calibration frequency of the SAR measurement probe (and used conversion factors)

SAR test frequency	Probe calibration frequency	Validity	Conversion factor	Uncertainty
2412, 2417, 2427MHz	2450MHz	within ± 50 MHz of calibration frequency	6.88	$\pm 12.0\%$
5230MHz	5200MHz	within ± 50 MHz of calibration frequency	4.35	$\pm 13.1\%$
5260, 5300MHz	5300MHz	within ± 50 MHz of calibration frequency	4.18	$\pm 13.1\%$
5550, 5680MHz	5600MHz	within ± 110 MHz of calibration frequency	3.81	$\pm 13.1\%$
5745, 5805MHz	5800MHz	within ± 110 MHz of calibration frequency	4.05	$\pm 13.1\%$

*. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band.

*a. The target value is a parameter defined in Appendix A of KDB865664 D01, the dielectric parameters suggested for head and body tissue simulating liquid are given at 2000, 2450, 3000 and 5800MHz. Parameters for the frequencies 2000-3000, 3000-5800MHz were obtained using linear interpolation, for above 5800MHz were obtained using linear extrapolation (Refer to appendix 3-4).

*b. Refer to KDB865664 D01, item 2), Clause 2.6; "When nominal tissue dielectric parameters are recorded in the probe calibration data; for example, only target values and tolerance are reported, the measured ϵ_r and σ of the liquid used in routine measurements must be: \leq the target ϵ_r and \geq the target σ values and also within 5% of the required target dielectric parameters."

c. The coefficients are parameters defined in clause E.3.3.2, IEEE Std 1528(2013). Since the measured liquid parameters were \leq the target ϵ_r and \geq the target σ values and also within 5% of the required target dielectric parameters, the measured SAR was not compensated by ΔSAR coefficients (. Clause 2) of 2.6, KDB865664 D01).

$$\Delta\text{SAR}(1g) = C_{\epsilon_r} \times \Delta\epsilon_r + C_{\sigma} \times \Delta\sigma, C_{\epsilon_r} = 7.854E-4 \times f^3 + 9.402E-3 \times f^2 - 2.742E-2 \times f + 0.2026 / C_{\sigma} = 9.804E-3 \times f^3 - 8.661E-2 \times f^2 + 2.981E-2 \times f + 0.7829$$

*d. Tuned-up SAR by scaled factor: Accordance with KDB447498 D01; "When SAR is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance (clause 4, 4.1, 4)".

*. Calculating formula: ΔSAR corrected SAR (1g) (W/kg) = (Observed SAR(1g) (W/kg)) \times (100 - ΔSAR (%)) / 100

Reported SAR(1g) (=Tuned-up SAR) (W/kg) = (Observed SAR(1g) (W/kg)) \times (Scaled factor)

7.2 SAR test results (Head)

- *. Since this EUT is the medical device, the EUT is only used under the guidance of a doctor or a qualified person. The possibility of the maximum RF human exposure is only a body/head of the patient who comes in contact directly on the front surface side (patient side) of the EUT. Therefore, the SAR test was only applied to the front surface side (patient side) of the EUT.

Notes: *1. At the highest output power channel, since the extrapolated maximum peak SAR for the maximum output channel was ≤1.6W/kg and the 1g averaged SAR was ≤0.8W/kg, the testing for other channels were omitted. (KDB248227)

*. Gap: It is the separation distance between the nearest position of platform outer surface and the bottom outer surface of phantom; n/a: not applied.

*. Battery No. #2 and #3 were same model. Refer to Appendix 1 for more details.

*. During test, the EUT was operated without all signal interface cables (except LAN cable for the Tx control) and with a full-charged battery.

*. Calibration frequency of the SAR measurement probe (and used conversion factors)

SAR test frequency	Probe calibration frequency	Validity	Conversion factor	Uncertainty
2412, 2417, 2427MHz	2450MHz	within ±50MHz of calibration frequency	6.94	±12.0%
5260, 5300MHz	5300MHz	within ±110MHz of calibration frequency	4.77	±13.1%
5680MHz	5600MHz	within ±110MHz of calibration frequency	4.42	±13.1%
5745, 5805MHz	5800MHz	within ±110MHz of calibration frequency	4.41	±13.1%

*. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band.

- a. The target value is a parameter defined in Appendix A of KDB865664 D01, the dielectric parameters suggested for head and body tissue simulating liquid are given at 2000, 2450, 3000 and 5800MHz. Parameters for the frequencies 2000-3000, 3000-5800MHz were obtained using linear interpolation, for above 5800MHz were obtained using linear extrapolation (Refer to appendix 3-4).
- b. Refer to KDB865664 D01, item 2), Clause 2.6: "When nominal tissue dielectric parameters are recorded in the probe calibration data; for example, only target values and tolerance are reported, the measured ϵ_r and σ of the liquid used in routine measurements must be: (for 2.4GHz band) \leq the target ϵ_r and \geq the target σ values and also within 5% of the required target dielectric parameters." (for 5GHz band) must be: within +5% and -10% of the target ϵ_r , and also within -5% and +10% of the target σ values, when the measured SAR is compensated for tissue dielectric deviations." Since ΔSAR correction value becomes smaller than measured value, compensation is not carried out.
- c. The coefficients are parameters defined in clause E.3.3.2, IEEE Std 1528(2013). Since the measured liquid parameters were \leq the target ϵ_r and \geq the target σ values and also within 5% of the required target dielectric parameters, the measured SAR was not compensated by ΔSAR coefficients (*, Clause 2) of 2.6, KDB865664 D01). $\Delta\text{SAR}(1g) = C_{\epsilon} \times \Delta\epsilon_r + C_{\sigma} \times \Delta\sigma$, $C_{\epsilon} = 7.854E-4\epsilon^3 + 9.402E-3\epsilon^2 - 2.742E-2\epsilon + 0.2026 / C_{\sigma} = 9.804E-3\sigma^3 - 8.661E-2\sigma^2 + 2.981E-2\sigma + 0.7829$
- d. Tuned-up SAR by scaled factor: Accordance with KDB 447498 D01; "When SAR is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance (clause 4, 4.1, 4)".
- . Calculating formula: ΔSAR corrected SAR (1g) (W/kg) = (Observed SAR(1g) (W/kg)) × (100 - (ΔSAR(%))) / 100
 Reported SAR(1g) (=Tuned-up SAR) (W/kg) = (Observed SAR(1g) (W/kg)) × (Scaled factor)
