Table of contents

Table of annex

Separate document annex 1: Measurement diagrams

Separate document annex 2: External photographs of EUT

Separate document annex 3: Test set-up photographs

The listed attachments are an integral part of this report.

Separate document annex 4: Internal photographs of EUT **to be supplied by the customer.**

1. Summary of test results

The test results apply exclusively to the test samples as presented in this report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

1.1. Tests measurement overview according of US CFR Title 47, Subpart 95:

Test cases	References & Limits		Test conditions (temperature and voltage)	EUT set-up	EUT opera-ting mode	Result
	Standard	Test Limit				
Max. peak power EIRP/ peak EIRP spectral density. Max. power EIRP/ average EIRP	FCC §95.3367 (a) (b)	50 dBm (Average) 55 dBm (Peak)	Nominal and extreme	1	1,2 + 3,4	passed
	RSS-251 (Section 8 and 9)	50 dBm (Average) 55 dBm (Peak)				
Modulation characteristics	FCC §2.1047 (d)	-	Nominal	1	1,2,3,4	passed
	RSS-251 (Section 6b)	-				
Occupied bandwidth	FCC §95.3379 (b)	76 GHz - 81 GHz	Nominal and extreme	1	1,2 + 3,4	passed
	RSS-251 (Section 7)	76 GHz - 81 GHz				
Field strength of emissions (band edge)	FCC §95.3379 (a)(2)(i)	600 pW/cm^2 ~ -1.7 dBm	Nominal	1	1,2,4	passed
	RSS-251 (Section 10)	lower BE: 0 dBm upper BE: -30 dBm				
Field strength of emissions (radiated spurious)	FCC §95.3379 (a)	9 kHz – 40 GHz: see section 5.5. in the report 40 GHz – 200 GHz: 600 pW/cm^2 ~ -1.7 dBm 200 GHz – 231 GHz: 1000 pW/cm^2 ~ 0.5 dBm	Nominal	1	1,2	passed
	RSS-251 (Section 10)	9 kHz – 40 GHz: see section 5.5. in the report 40 GHz – 162 GHz*: -30 dBm Here 73.5 GHz – 76 GHz: 0 dBm				
Frequency stability	FCC §95.3379 (b)	-	Nominal and extreme	1	1,2	passed
	RSS-251 (Section 11)	RSS-251 (Subsection 11.2)				

1.2. Attestation:

I declare that all measurements were performed by me or under my supervision and that all measurements have been performed and are correct to my best knowledge and belief to Industry Canada standards. All requirements as shown in above table are met in accordance with enumerated standards.
The current version of the Test Report 18-1-0093201T01a-C1 replaces the Test Report 18-1-0093201T01a-C1 dated 11.12.2018. The replaced Test Report is herewith invalid.

3.4. EUT set-ups

EUT set-up no.*)	Combination of EUT and AE	Remarks
set. 1	EUT A + AE 1 + AE 2	Radiated RF-setup, AE1 and AE2 are connected to the EUT during the whole measurement

*) EUT set-up no. is used to simplify the identification of the EUT set-up in this test report.

3.5. EUT operating modes

EUT operating mode no.*)	Description of operating modes	Additional information		
op. 1	Advanced Emergency Braking (AEB)	f_c=76.365 GHz, 500 MHz < BW < 600 MHz		
op. 2	Adaptive Cruise Control (ACC)	200 MHz < BW < 300 MHz	Low	76.125 GHz
			Default	76.365 GHz
			High	76.605 GHz

*) EUT operating mode no. is used to simplify the test report.

4. Description of test system set-up's

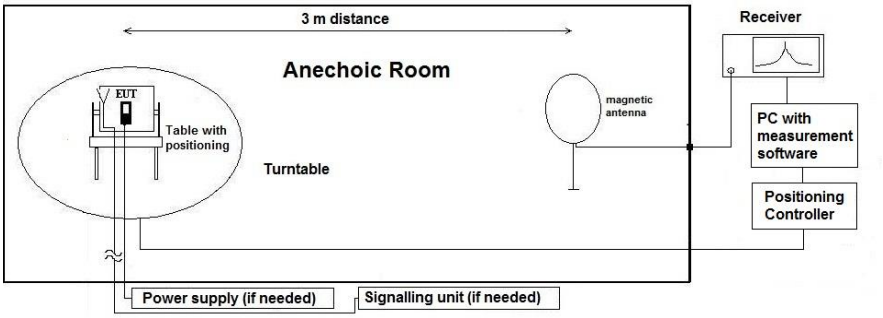
4.1. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification: ANSI C63.4-2014 §5.3, §8.2.1, §8.3.1.1+§8.3.2.1 , ANSI C63.10-2013 chapter 6.4 (§6.4.4.2)

General Description: Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed in the semi anechoic room recognized by the regulatory commission.

Schematic:



Testing method:

Exploratory, preliminary measurement
The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0°to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$

$M = L_T - E_C$

AF =Antenna factor
C_L = Cable loss
D_F= Distance correction factor
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A= Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

All units are dB-units, positive margin means value is below limit.

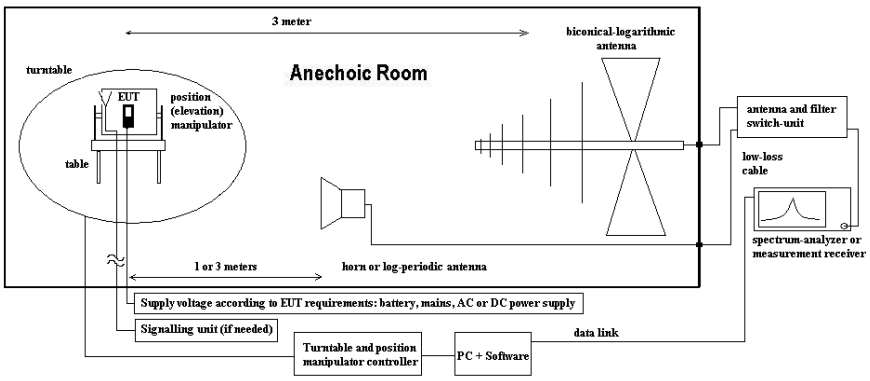
Distance correction: Reference for applied correction (extrapolating) factors due to reduced measurement distance:
ANSI C63.10:2013, §6.4.4.2 - Equations (2) + (3) + (4)

4.2. Test system set-up for radiated electric field measurement 30 MHz to 960MHz

Specification: ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description: Evaluating the field emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the regulatory commissions.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 90°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semi-anechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A = Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

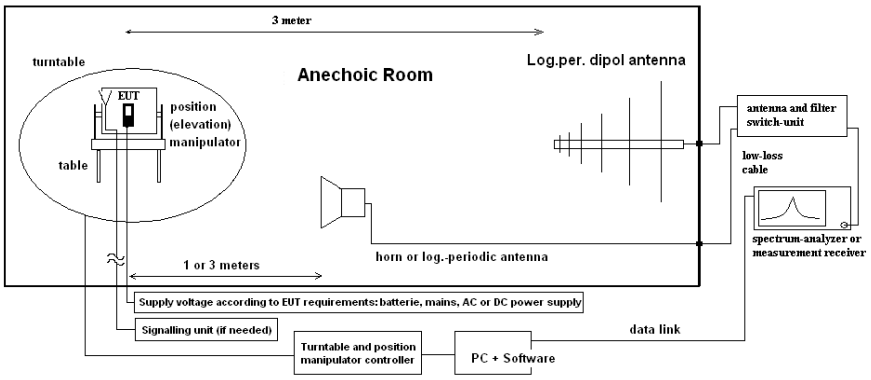
All units are dB-units, positive margin means value is below limit.

4.3. Test system set-up for radiated electric field measurement above 960MHz

Specification: ANSI C63.10-2013, chapter 10.3

General Description: The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 1 m or 3 m. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.55 m height which is placed on the turntable. By rotating the turntable continuously (range 0° to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.
The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

E_C = Electrical field – corrected value
E_R = Receiver reading
M = Margin
L_T = Limit
AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
G_A = Gain of pre-amplifier (if used)

All units are dB-units, positive margin means value is below limit.

5.1.2. Reference

FCC/RSS	See section 1.1.
ANSI	C63.10-2013

5.1.3. Limits

See section 1.1. in the report.

5.1.4. Test environment

Temperature	Nominal: 22±3 °C Extreme, min.: -40 °C Extreme, max.: -74 °C
Rel. humidity	(40±20)%
Power supply	Nominal: 12 V Extreme, min.: 8 V Extreme, max.: 32 V

5.1.5. Spectrum-Analyzer settings:

Span	> 1 GHz
Resolution Bandwidth (RBW)	1 MHz
Video Bandwidth (VBW)	Minimum 3 times the resolution bandwidth
Sweep time	Auto-coupled
Detector	Peak detector with max peak search. RMS with channel power measurement.
Sweep mode	Repetitive Mode, MAX-HOLD, trace stabilization

5.1.6. Measurement method:

All the measurements are done according to standards and rules listed in subsection 5.1.2. The measured power is EIRP*.

The EUT is ON. At first all modes are tested with normal/nominal conditions. Mode 2 has 3 frequency bands with low, default and high center frequency. Each frequency band is also measured with nominal conditions. Then a worst case is chosen from these 3 measurements. Here frequency band LOW was chosen due to the fact, that it has the highest power and it is located close to the limit frequency. Then the EUT with mode 1 and mode 2 worst case are tested in the climate cabinet with different temperatures and voltages.
* Equivalent Isotropic Radiated Power

5.1.7. Results

Nominal conditions				Verdict
Op. Mode:		Power measurement		
		Peak detector, max peak search (marker) [dBm]	RMS detector, channel power measurement [dBm]	
1		26.1	41.2	Pass
2	Low	30.9	47.7	Pass*
	Default	30.2	46.5	Pass
	High	30.4	46.3	Pass
Extreme conditions				
1		See Annex 1	See Annex 1	Pass
2	Low	See Annex 1	See Annex 1	Pass

Remark: For graphical results pls. see annex 1 to this test report.
* Frequency band LOW for Mode 2 shows the highest power value. **This frequency band will be used furthermore for other measurements for this mode.**

5.2.2. Reference

FCC	FCC §2.1047 (d) RSS-251 (Section 6b)

5.2.3. Description:

FCC §2.1047 (d): *Other types of equipment. A curve or equivalent data which shows that the equipment will meet the modulation requirements of the rules under which the equipment is to be licensed.*
RSS-251 (Section 6b): *Non-pulsed radar (e.g. frequency modulated continuous wave (FMCW)): modulation type (i.e. sawtooth, sinusoid, triangle, or square wave) and sweep characteristics (sweep bandwidth, sweep rate, sweep time).*

5.2.4. Test environment

Temperature	Nominal: 22±3 °C
Rel. humidity	(40±20)%
Power supply	Nominal: 12 V

5.2.5. Spectrum-Analyzer settings:

Span	> 1 GHz
Resolution Bandwidth (RBW)	1 MHz
Video Bandwidth (VBW)	Minimum 3 times the resolution bandwidth
Sweep time	Auto-coupled
Detector	Peak detector.
Sweep mode	Repetitive Mode, MAX-HOLD, trace stabilization

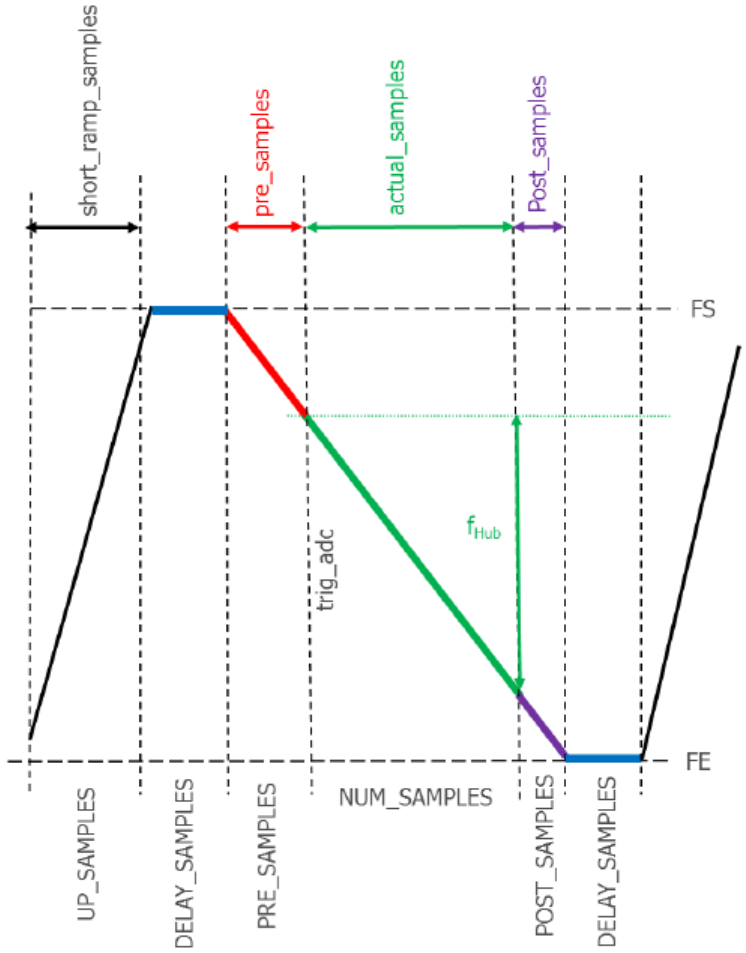
5.2.6. Measurement method:

Start and stop frequency was measured for all operating modes and all frequency bands with nominal conditions. Wave form and sweep characteristics were supplied by applicant.

5.2.7. Results

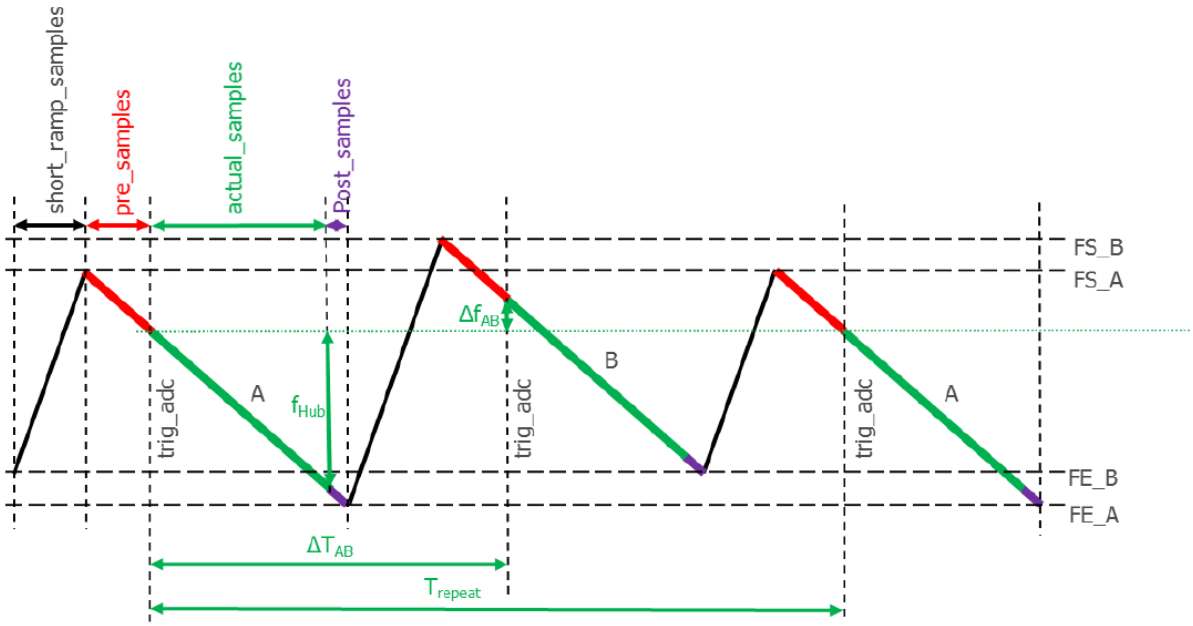
For graphical results for start and stop frequency pls. see annex 1 to this test report.
The applicant supplied following information about wave form and sweep characteristics:

The waveform consists of linear FM ramps, as shown in Figure (I). Normally Downchirps (falling frequency ramps) are used for the 2D-FFT. For classical structure or A-Waveform, as we call them, these ramps are repeated over time.



Figer (I).

A second waveform, we call AB-waveform, uses 2 similar ramps, which have the same timing and slope, but are shifted in frequency (ramp B has a frequency offset to ramp A – AB shift). This is shown in Figure (II).



Figer (II).

Waveform Parameters:
Waveform Mode 0 - 166MHz:

Table 1: Waveform Mode 0

Waveform	AB
Frequency Hub	166 MHz
Used BW (measured)	217 MHz
T_{chirp}	62,0µs
Transmit period	16,12 ms
Non-Transmit period	38,88 ms
Cycle Time	Typically 55ms

Waveform Mode 1 - 450MHz:

Table 2: Waveform Mode 1

Waveform	AB
Frequency Hub	450MHz
Used BW (measured)	583 MHz
T_{chirp}	62,0µs
Transmit period	16,12 ms
Non-Transmit period	38,88 ms
Cycle Time	Typically 55ms

5.3. Occupied bandwidth

5.3.1. Test location and equipment

See section 5.1.1.

5.3.2. Reference

FCC	See section 1.1. in the report.

5.3.3. Limits

See section 1.1. in the report.

5.3.4. Test environment

Temperature	Nominal: 22±3 °C (all modes and FB) Extreme, min.: -40 °C (mode 1 and mode 2 FB Low) Extreme, max.: -74 °C (mode 1 and mode 2 FB Low)
Rel. humidity	(40±20)%
Power supply	Nominal: 12 V (all modes and FB) Extreme, min.: 8 V (mode 1 and mode 2 FB Low) Extreme, max.: 32 V (mode 1 and mode 2 FB Low)

5.3.5. Spectrum-Analyzer settings:

Span	> 1 GHz
Resolution Bandwidth (RBW)	1 MHz
Video Bandwidth (VBW)	Minimum 3 times the resolution bandwidth
Sweep time	Auto-coupled
Detector	Peak detector
Sweep mode	Repetitive Mode, MAX-HOLD, trace stabilization

5.3.6. Measurement method:

Occupied bandwidth was measured for all operating modes and all frequency bands with nominal conditions. Mode 1 and Mode 2 FB Low are measured also with extreme conditions (see section 5.1.). Occupied bandwidth (99 %) function is activated in spectrum analyzer for this measurement.

5.3.7. Results

Nominal conditions					Verdict

1		See Annex 1	See Annex 1		Pass
2	Low	See Annex 1	See Annex 1		Pass

Remark: For graphical results pls. see annex 1 to this test report.

5.4. Field strength of emissions (band edge)

5.4.1. Test location and equipment

See section 5.2.1.

5.4.2. Reference

FCC	See section 1.1. in the report.

5.4.3. Limits:

See section 1.1. in the report.

5.4.4. Test environment

Temperature	Nominal: 22±3 °C
Rel. humidity	(40±20)%
Power supply	Nominal: 12 V

5.4.5. Spectrum-Analyzer settings:

Span	> 1 GHz
Resolution Bandwidth (RBW)	1 MHz
Video Bandwidth (VBW)	Minimum 3 times the resolution bandwidth
Sweep time	Auto-coupled
Detector	Peak detector + RMS detector
Sweep mode	Repetitive Mode, MAX-HOLD, trace stabilization

5.4.6. Measurement method:

Low and high band edge was measured for mode 1. Low band edge was measured for mode 2 FB Low. High band edge was measured for mode 2 FB High.

5.4.7. Verdict

Pass. For graphical results pls. see annex 1 to this test report.

5.5. Radiated field strength emissions (below 30 MHz)

5.5.4. Measurement method:

Measurement is done for mode 1 and mode 2 FB Low. Mode 2 FB Low was chosen due to the fact that it has the highest power. See section 1.1. Mode 2 FB Low, Default and High differs only in center frequency. All other characteristics are identical.

5.5.5. Verdict

Pass. For graphical results pls. see annex 1 to this test report.

5.5.6. Correction factors due to reduced meas. distance (f< 30 MHz)

The used correction factors when the measurement distance is reduced compared to regulatory measurement distance, are calculated according Extrapolation formulas valid for EUT's with maximum dimension of 0.625xLambda. Formula 2+3+4 as presented in ANSI C63.10, Chapter 6.4.4 are used for the calculations of proper extrapolation factors.

Frequency -Range	f [kHz/MHz]	Lambda [m]	Far-Field Point [m]	Distance Limit accord. 15.209 [m]	1st Condition (dmeas< $D_{near-field}$)	2'te Condition (Limit distance bigger $d_{near-field}$)	Distance Correction accord. Formula

5.8.2. Reference

Standard	See section 1.1. in the report.

5.8.3. Limits:

See section 1.1. in the report.

5.8.4. Test environment

Temperature	Nominal: 22±3 °C
Rel. humidity	(40±20)%
Power supply	Nominal: 12 V

5.8.5. Spectrum-Analyzer settings*:

Resolution Bandwidth (RBW)	1 MHz
Video Bandwidth (VBW)	Minimum 3 times the resolution bandwidth
Sweep time	≤ 1 s
Detector	RMS detector.
Sweep mode	Repetitive Mode, MAX-HOLD, trace stabilization

* See also settings on the screenshots from the spectrum analyzer in Annex 1

5.8.6. Measurement method:

Measurement is done for mode 1 and mode 2 FB Low. Mode 2 FB Low was chosen due to the fact that it has the highest power. See section 1.1. Mode 2 FB Low, Default and High differs only in center frequency. All other characteristics are identical.

The measurement in the frequency range 40 GHz – 55 GHz are made direct with the spectrum analyzer without mixer. The measurements above 55 GHz are made with the mixer. There is a ref level line in all measurements. This line is not to mistake for limit line.

Signal ID function is used for the most measurement above 55 GHz: *two sweeps are performed alternately. Trace 1 shows the trace measured on the upper side band (USB) of the LO (the test sweep), trace 2 shows the trace measured on the lower side band (LSB), i.e. the reference sweep.*

*The reference sweep is performed using an LO setting shifted downwards by 2*IF/<Harmonic order>. Input signals in the desired sideband that are converted using the specified harmonic are displayed in both traces at the*

same position on the frequency axis. Image signals and mixer products caused by other harmonics are displayed at different positions in both traces. The user identifies the signals visually by comparing the two traces.
Since the LO frequency is displaced downwards in the reference sweep, the conversion loss of the mixer may differ from the test sweep. Therefore the signal level should only be measured in the test sweep (trace 1).
For signal ID function three screenshots were made always. The first one: USB + LSB. The second one: LSB. The third one: USB. All the screenshots are compared to differ the input signal from the image signal or mixer product. Traces on all diagrams up to 200 GHz include all losses inclusive antenna gain and free-space path loss. The SW of the spectrum analyzer doesn't permit to include antenna gain and free-space path loss in the trace for frequency range above 200 GHz. The real noise level for the measurements above 200 GHz is calculated in the table below:

200 GHz – 220 GHz					
Column identification	A	B	C	D	-
Frequency [GHz]	Antenna gain [dBi]	Free-space path loss [dB] for 1 m	Noise level read by spectrum analyzer [dBm]	A + B + C Calculate noise level, [dBm]	Limit [dBm]/ Verdict
200	-23.75	78.52	-74.72	-19.95	0.5/ ok
210	-24.15	78.95	-75.78	-20.98	0.5/ ok
220	-24.5	79.35	-76.96	-22.11	0.5/ ok
220 GHz – 231 GHz					
Frequency [GHz]	Antenna gain [dBi]	Free-space path loss [dB] for 0.5 m	Noise level read by spectrum analyzer [dBm]	A + B + C Calculate noise level, [dBm]	Limit [dBm]/ Verdict
220	-19.8	73.33	-67.87	-14.34	0.5/ ok
225.5	-20	73.54	-69.42	-15.88	0.5/ ok
231	-20.2	73.75	-69.87	-16.32	0.5/ ok

200 GHz – 220 GHz	1
220 GHz – 231 GHz	0.5

5.8.6.1. Verdict
Pass. For graphical results pls. see annex 1 to this test report.

5.9. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor **k**, such that a confidence level of approximately 95% is achieved.
For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Calculated uncertainty based on a confidence level of 95%						Remarks
Conducted emissions (U_{CISPR})	CISPR 16-2-1	9 kHz - 150 kHz 150 kHz - 30 MHz	4.0 dB 3.6 dB						-
Radiated emissions Enclosure	CISPR 16-2-3	30 MHz - 1 GHz 1 GHz - 18 GHz	4.2 dB 5.1 dB						E-Field
Disturbance power	CISPR 16-2-2	30 MHz - 300 MHz	-						-
Power Output radiated	-	30 MHz - 4 GHz	3.17 dB						Substitution method
		24 GHz	3.24 dB						
		76-77GHz	3.32 dB						
Power Output conducted	-	Set-up No.	Cel-C1	Cel-C2	BT1	W1	W2	--	
		9 kHz - 12.75 GHz	N/A	0.60	0.7	0.25	N/A	--	-
		12.75 - 26.5GHz	N/A	0.82	--	N/A	N/A	--	
Conducted emissions on RF-port	-	9 kHz - 2.8 GHz	0.70	N/A	0.70	N/A	0.69	--	N/A - not applicable
		2.8 GHz - 12.75GHz	1.48	N/A	1.51	N/A	1.43	--	
		12.75 GHz - 18GHz	1.81	N/A	1.83	N/A	1.77	--	
		18 GHz - 26.5GHz	1.83	N/A	1.85	N/A	1.79	--	
Power density	-	1 – 2.8GHz	1.40 dB						--
Occupied bandwidth	-	9 kHz - 4 GHz	0.1272 ppm (Delta Marker)						Frequency error
			1.0 dB						Power
Emission bandwidth	- -	9 kHz - 4 GHz	0.1272 ppm (Delta Marker) See above: 0.70 dB						Frequency error Power
Frequency stability	-	9 kHz - 20 GHz	0.0636 ppm						--
Radiated emissions Enclosure	-	150 kHz - 30 MHz	5.0 dB						Magnetic field
		30 MHz - 1 GHz	4.2 dB						E-field
		1 GHz - 18 GHz	3.17 dB						Substitution Method
		18-33 GHz	3.60 dB						
		33-50 GHz	3.99 dB						
		40-60 GHz	3.95 dB						

Table: measurement uncertainties, valid for conducted/radiated measurements

6. Abbreviations used in this report

The abbreviations	
ANSI	American National Standards Institute
AV , AVG, CAV	Average detector
EIRP	Equivalent isotropically radiated power, determined within a separate measurement
EGPRS	Enhanced General Packet Radio Service
EUT	Equipment Under Test
FCC	Federal Communications Commission, USA
IC	Industry Canada
n.a.	not applicable
Op-Mode	Operating mode of the equipment
PK	Peak
RBW	resolution bandwidth
RF	Radio frequency
RSS	Radio Standards Specification, Dokuments from Industry Canada
Rx	Receiver
TCH	Traffic channel
Tx	Transmitter
QP	Quasi peak detector
VBW	Video bandwidth
ERP	Effective radiated power

7. Accreditation details of CETECOM's laboratories and test sites

Ref.-No.	Accreditation Certificate	Valid for laboratory area or test site	Accreditation Body

8.1.3. Legend

Note / remarks		Calibrated during system calibration:
	1a	System CTC-SAR-EMS (Ref.-No. 442)
	1b	System-CTC-EMS-Conducted (Ref.-No. 335)
	1c	System CTC-FAR-EMI-RSE (Ref.-No . 443)
	1d	System CTC-SAR-EMI (Ref.-No . 441)
	1e	System CTC-OATS (EMI radiated) (Ref.-No. 337)
	1 f	System CTC-CTIA-OTA (Ref.-No . 420)
	1 g	System CTC-FAR-EMS (Ref.-No . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months, between this every 12 months internal validation
	36/12 M	Calibration every 36 months, between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	-	Without calibration

9. Versions of test reports (change history)

Version	Applied changes	Date of release
	Initial release	2018-12-11
C1	The name of the section 5.1. was corrected. Subsection „References“ was corrected for all sections. Description of the measurement method in subsection 5.1.6. was made more detailed. Designation in the table in subsection 5.1.7. were corrected.	2019-03-20

The End of the Report
