## Laboratory Introduction

SIEMIC, headquartered in the heart of Silicon Valley, with superior facilities in US and Asia, is one of the leading independent testing and certification facilities providing customers with one-stop shop services for Compliance Testing and Global Certifications.

In addition to testing and certification, SIEMIC provides initial design reviews and compliance management throughout a project. Our extensive experience with China, Asia Pacific, North America, European, and International compliance requirements, assures the fastest, most cost effective way to attain regulatory compliance for the global markets.

## 2 Executive Summary

The purpose of this test program was to demonstrate compliance of following product

Company: ChargePoint, Inc.  
Product: Network Communication / RFID Reader  
Model No.: 28010077/ 28010087  
Host Model No. CPF12 & CPF25

against the current Stipulated Standards. The specified model product stated above has demonstrated compliance with the Stipulated Standard listed on 1<sup>st</sup> page.

## 6 EUT Information

### 6.1 EUT Description

Product Name	Network Communication / RFID Reader
Model No.	28010077/ 28010087
Serial No.	Prototype 1
Trade Name	ChargePoint, Inc.
Host Model No.	CPF12 & CPF25
Input Power	100-240VDC, 50/60Hz
Product Hardware version	28-010087
Product Software version	4.0.1.100
Radio Hardware version	28-010087
Radio Software version	4.0.1.100
Date of EUT received	08/21/2015
Equipment Class/ Category	DTS
Operating Frequencies	13.56MHz , 2412-2462MHz
Port/Connectors	N/A

## 10 Measurements, Examination and Derived Results

### 10.1 Radiated Measurements

#### 10.1.1 Radiated Measurements below 30MHz

**Requirement(s):**

Specification(s)	Requirement	Applicable									
47 CFR §15.225 RSS Gen 6.4	Operation within the band 13.110–14.010 MHz (a) The field strength of any emissions within the band 13.553–13.567 MHz shall not exceed 15,848 microvolts/meter at 30 meters. (b) Within the bands 13.410–13.553 MHz and 13.567–13.710 MHz, the field strength of any emissions shall not exceed 334 microvolts/meter at 30 meters. (c) Within the bands 13.110–13.410 MHz and 13.710–14.010 MHz the field strength of any emissions shall not exceed 106 microvolts/meter at 30 meters. (d) The field strength of any emissions appearing outside of the 13.110–14.010 MHz band shall not exceed the general radiated emission limits in §15.209.	<input checked="" type="checkbox"/>									
Test Setup	<ol style="list-style-type: none"> <li>The EUT and supporting equipment were set up in accordance with the requirements of the standard on top of a 1.5m X 1.0m X 0.8m high, non-metallic table.</li> <li>The filtered power supply for the EUT and supporting equipment were tapped from the appropriate power sockets located on the turntable.</li> <li>The relevant loop antenna was set at the required test distance away from the EUT and supporting equipment boundary.</li> </ol>										
Procedure	For < 30MHz, Radiated emissions were measured according to ANSI C63.10. The EUT was set to transmit at the highest output power. The EUT was set 3 meter away from the measuring antenna. The loop antenna was positioned 1 meter above the ground from the centre of the loop. The measuring bandwidth was set to 10 kHz. The limit is converted from microvolt/meter to decibel microvolt/meter.

Procedure	1.	2.	3.	4.
	The EUT was switched on and allowed to warm up to its normal operating condition.	The test was carried out at the selected frequency points obtained from the EUT characterisation. Maximization of the emissions, was carried out by rotating the EUT, changing the antenna polarization, and adjusting the antenna height in the following manner:	a. Vertical or horizontal polarisation (whichever gave the higher emission level over a full rotation of the EUT) was chosen.	b. The EUT was then rotated to the direction that gave the maximum emission.
			c. Finally, the antenna height was adjusted to the height that gave the maximum emission.	

Test Date	08/04/2015	Environmental conditions	Temperature 25.5°C Relative Humidity 44.4% Atmospheric Pressure 1026mbar

**10.2 Radiated Spurious Emissions in restricted band**

**Requirement(s):**

Specification(s)	Item	Requirement	Applicable
47CFR§15.247(d), RSS Gen 8.10	a)	For non-restricted band, In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB or 30dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, determined by the measurement method on output power to be used. Attenuation below the general limits specified in § 15.209(a) is not required  <input type="checkbox"/> 20 dB down <input checked="" type="checkbox"/> 30 dB down	<input checked="" type="checkbox"/>
	b)	or restricted band, emission must also comply with the radiated emission limits specified in 15.209	<input checked="" type="checkbox"/>
Test Setup			
Procedure	<ol style="list-style-type: none"> <li>The EUT was switched on and allowed to warm up to its normal operating condition.</li> <li>The test was carried out at the selected frequency points obtained from the EUT characterisation. Maximization of the emissions, was carried out by rotating the EUT, changing the antenna polarization, and adjusting the antenna height in the following manner: <ol style="list-style-type: none"> <li>Vertical or horizontal polarisation (whichever gave the higher emission level over a full rotation of the EUT) was chosen.</li> <li>The EUT was then rotated to the direction that gave the maximum emission.</li> <li>Finally, the antenna height was adjusted to the height that gave the maximum emission.</li> </ol> </li> <li>An average measurement was then made for that frequency point.</li> <li>Steps 2 and 3 were repeated for the next frequency point, until all selected frequency points were measured.</li> </ol>		
Remark	The EUT was scanned up to 25GHz. Both horizontal and vertical polarities were investigated. The results show only the worst case. Radiated measurement was measured with antenna port terminated, there isn't outstanding emission found at the edge of restricted frequency, within x dB margin
